2047 A. I don't understand that to be the fact, never have understood it. I suppose they were always based upon straight mileage within the State.

Mr. ELLIS. I think the reports so indicate, that they are.

Q. (By Mr. SPENCER.) Does that make any difference in your calculations, if you are wrong on that?

A. Not at all. Whether the O.-W. R. & N. is making more money or less money, it is entitled to its traffic within reason and would lose by the diversion of it, of course.

Q. Well, it is really an emergency, as far as the O.-W. R. & N. system is concerned, isn't it?

A. Well, I am not aware of that.

Q. Well, if it has run $7,000,000 or $8,000,000 into a deficit, with divisions like that over a period of the last 7 or 8 years—— (3715.)

A. Well, there seems to be a difference of opinion between you and Mr. Ellis, who, I think, should know as regards the revenues reported to the commission of this State.

Q. You think he ought to know?

A. He says you are wrong in regard to that, and he is in accordance with what I have always understood to be the method of the showing.

Q. Well, if the exhibits in this case show that the O.-W. R. & N. receives those divisions reflected by Exhibit 89, contemplating now its entire operation and not its operation in Oregon alone, it receives those divisions and receives the earnings local to its lines, and the reports to the commission, State and interstate, by the Oregon-Washington Railroad & Navigation Company are accordingly, and they as well as its general balance sheet show that it has accumulated a deficit from operations in the last 6 or 7 years, or 7 or 8 years, of $8,000,000 or $9,000,000, or $7,000,000 or $8,000,000, it is not making a very good showing, is it?

A. It is not.

2048 Q. You know that is its condition, don't you, Mr. Newell?

A. I know that the reports to the public service commission indicate such a condition. (3716.)

I have taken all of the traffic that these different witnesses have brought in that is originated in western Oregon, southwestern Idaho, southeastern Oregon, Alkali Lake and all, and applied these rates to it, and then presented a summary in my Exhibit 107 that will show, before the Alturas line, a profit and rate of return on the first year of the cross-State line, of 17 per cent. I don't suppose there is any railroad in the western world that has ever made such showing as that. And the second year I show 19 per cent; the third 21 per cent. I have done that on the assumption that this traffic these gentlemen have pointed out to me is going to be available and move over that line.

Q. Now you know it is not going to move, from your own observation, experience, and knowledge in this territory as a railroad man, don't you? (3717.)

A. I don't know anything of the sort.

Q. Didn't you in the last case on this cross-State line take tonnage from a young man down here at the university, of 600,000 tons of hay and apply figures to it the same as you are applying here now?

A. I applied some figures to it, but that matter came to me in the midst of the hearing itself. I had no time to give it any consideration at all as to whether——

Q. Well, I called it to your attention at the time, didn't I?

A. And I answered your questions.

Q. And you said that you didn't see any reason why it would not move, didn't you?

A. I don't recall in regard to that.

Q. Well, you knew it would not move, didn't you?

A. I didn't know that. I had no opportunity——

2049 Q. You know it won't in this case, don't you.

A. I had no opportunity to make any study of it at that time. I have been informed that since that time the hay situation has changed considerably, so that whatever was true at that time would probably be not true now. But that is all second-hand information.

Q. Yes; now in this very tabulation that you have made here, based on Wiggins' testimony and the testimony of these other witnesses, you are moving hay from Southern Idaho via the Crescent Lake Junction to Los Angeles. Now do you think there (3718) is going to a ton of it move that way?

A. That is not true. There is no statement that it is moving to Los Angeles, or will move to Los Angeles.

Q. Why, I understood you to embrace in this Mr. Wiggins' Exhibit 104, 24 cars of hay from Boise, Idaho, 1,254.7 miles to Los Angeles via Crescent?

A. He has such figures there used in his derivation of a ton-mile rate of earnings proper to be attributed to a haul across the cross-State line. Now he and I discussed these matters beforehand, and I know, independent of what he said on the stand—I could not follow all of those questions, but I know that he was using that solely for the purpose of obtaining a suitable ton-mile earning rate to be applied and had no reference at all to the question whether or not it would actually move to Los Angeles.

Q. Well, what object did he have in obtaining a ton-mile rate on traffic that he knew would never move?

A. He would not know, as a matter of course, that none of it would move. The statement was made by these Idaho witnesses that that tonnage would go to California points, stating expressly, I believe, that it would go to San Francisco and that territory. I do not know whether they said it would go to Los Angeles. In

2050 our consideration of that, because I was consulted by Mr. Wiggins in these matters, he had before him the problem of determining a ton-mile rate, a rate to be (3719) applied. He took the intermediate rate existing to San Francisco and a rate that would exist, or, I believe, does exist, to Los Angeles, on the longer distance, and out of the mean of those two he obtained a ton-mile rate which would certainly be not any higher than would be determined by actual movements of hay to whatever points it might go to.

The statements in Exhibit 104 giving point of origin, destination and number of tons, number of cars, and rates per 100 pounds, mean

nothing as to the destination of the traffic. They mean a great deal as to the manner in which Mr. Wiggins determined a proper ton-mile rate of earnings to be applied. That is their sole purpose, and he so testified.

Mr. Wiggins prepared an exhibit splitting everything fifty-fifty, grain, hay, apples, and all these other commodities so that he might obtain an average figure of the longest haul possible in the intent of the Idaho witnesses, and a shorter haul, so that the mean of the two would be at least as long as could fairly be attributed to it. He does not summarize it here and move it to Los Angeles and San Francisco; he points out what it would cost per ton-mile, or what it would earn per ton-mile if it did move to those places. (3720.) I certainly do not know where it moves. I think he said he does not, either.

Exam. ROGERS. This exhibit assumes that it is going to move to certain destinations, doesn't it?

A. I don't understand the exhibit to be intended for that purpose. You are speaking of Mr. Wiggins' exhibit?

Exam. ROGERS. Yes.

A. My understanding of those showings of those destinations is purely for the purpose of obtaining a suitable ton-mile earning rate.

2051 Exam. ROGERS. But it assumes it will move across the cross-State line?

A. Yes; because it would have to do that according to the statement of the Idaho witnesses, to reach any of those California points they had in mind. If it had been assumed that it would all go to San Francisco, there would have been obtained a higher rate of earning per ton mile than we used.

Comr. MCMANAMY. If it actually moves across the cross-State line it does not make any difference what destination it goes to, so far as the application of the earnings to the cross-State line are concerned?

A. That is correct. (3721.)

Exam. ROGERS. Well, it might make a difference if Los Angeles traffic is going to move across the cross-State line or is going down over the Los Angeles & Salt Lake?

A. That is perfectly true, but that does not necessarily enter into it. Take that hay. I think it is 48 cars, is it not? I haven't the exhibit before me—a small number of cars. The Idaho witnesses said that hay would go to California points.

That was their testimony, that it would use the cross-State line. That is as far as Mr. Wiggins and I had any occasion to know about. We were simply looking for a proper rate of earning to apply to it.

Turning to my Exhibit 107, page 5, I take those same commodities, the same number of cars, that Mr. Wiggins analyzes and discusses in such great detail in his Exhibit 104, and I show the gross earn-

ing of $158,531, the same as he shows. Those figures are taken from his exhibit. I follow his exhibits right through. (3722.) He finds for the haul to Los Angeles 1.12 and some other figures for the rate per ton mile under the existing rate; to San Francisco
1.61. He applies the mean to those two to the 189 miles and
2052 the 705 tons which the Idaho witnesses said would move across the cross-State line, and from that obtains the figure of $1,814.00 shown as the revenue to the cross-State line.

Now it has no reference at all to whether it is actually hauled to San Francisco, Los Angeles, or any other California point.

I don't know what Idaho witnesses said it was going to move via the cross-State line. I didn't hear the Idaho witnesses. I was told that was their testimony. (3723.)

Exam. ROGER. As I understand, Mr. Newell, your thought is this: That if it is certain, in the first place, that the traffic is going to move across the cross-State line, it does not make much difference whether it is destined to San Francisco or to Los Angeles?

A. Not a particle.

Exam. ROGERS. If it is going to move across the cross-State line?

A. Yes; if it is going to move.

Exam. ROGERS. The trouble is to know whether the Los Angeles traffic is going to move across the cross-State line, in the first place, isn't it?

A. I think that is doubtful, but I say these witnesses——

Exam. ROGERS. You have started with the assumption it is going to move across the cross-State line because these other witnesses have said so?

A. Yes; but I don't understand they said it would move across the cross-State line if it were going to Los Angeles.

Exam. ROGERS. Well, that would be——

A. But they do say that many cars will move over the cross-State line.

Comr. MCMANAMY. And except for the determination of the rate per ton-mile Los Angeles might be left out of the computation entirely?

A. Entirely; yes. (3724.)

2053 And I took the mean of the Los Angeles rate, that is the rate per ton mile to be realized in the haul to Los Angeles, and the rate that would be realized to San Francisco, and applied the average to the whole tonnage. That does not assume that half of it is going to Los Angeles and half to San Francisco. As to why I applied that average rate then, it merely assumes that a mean of those two rates is a fair rate per ton mile to attribute to that cross-State haul, even if it is lower than the present rate to San Francisco, because for this purpose quite obviously it would be to our interest to make this as high as we could, if we wanted to present a false statement. But we wanted to present a conservative statement and we included Los Angeles from that standpoint.

I said, in answer to the commissioner's question, that as far as this computation was concerned it would not make any difference whether it was destined to San Francisco or Los Angeles so long as it was going to California; that is the question (3725) we are interested in—as long as it is going to cross the cross-State line. It might make a difference, in the first place, if it was going to Los Angeles, as to whether it would go across the cross-State line. But I must assume that the Idaho witnesses had taken that into account and didn't put into their calculations anything that was doubtful in that respect. I can't answer for them. That is the presumption I started with—that what they said would move across the cross-State line would move that way.

On page 2 of my Exhibit 107 I mention an exhibit by Mr. Wiggins showing gross earnings of $6,302.00. (3726.) The exhibit number there was left blank. To make that complete 105 should be inserted. That is Mr. Wiggin's Exhibit 105. Three lines below, on page 2 of my Exhibit 107, in which the exhibit number is left blank, the exhibit number is 105; also the last line on page 2. Three times on page 3 of my Exhibit No. 107, exhibits are referred to, with the exhibit number blank, and in each instance 105 should be
2054 inserted. (3727.) On page 5 of my Exhibit 107, Newton's Exhibit — is erroneously referred to. That should be Spangler's Exhibit 23 and in the last line at the bottom Exhibit 105 again, page 5.

Q. (By Mr. SPENCER.) Now right there, Mr. Newell, you say these witnesses have represented that is going to California; wasn't the representation that that is westbound business that might go via the proposed cross-State line? If it would go by the proposed cross-State line it would go by the existing routes, wouldn't it, if it was destined to Portland, or Seattle—Spangler's Exhibit 23?

A. Yes. But this was represented as commodities that would go to California.

Q. By whom?

A. By the Spangler exhibit.

Q. I wish you would look at Spangler's exhibit and tell me where, point out on that Spangler exhibit where he represents it is going to California, or any part of it.

A. I did not myself study the exhibit. (3728.)

Exam. ROGERS. I would like also to ask if you took into consideration the oral testimony, or just took it from the exhibits?

A. We had only the exhibits. We were not able to be here and hear the testimony of the witnesses; at least, I was not, and I know Mr. Wiggins was not most of the time.

Exam. ROGERS. Well, have you reviewed the record?

A. Well, these matters I myself have got from Mr. Wiggins. Now at the time we were making this up it wasn't certain which of us was going on the stand first, and I put these references in, as he told me they would be.

Exam. ROGERS. What I am after is, did you or Mr. Wiggins examine the record before you made your computation, or did you just take the exhibits of the other witnesses?

A. You will have to ask Mr. Wiggins that, because he did that and told me the result. (3729.)

2055 Q. Well, you were working there together, were you not?

A. Yes; but he was——

Q. And you know whether he was studying this manuscript and record that came out, or whether he was using the exhibits?

A. Why, as far as I know, I don't know if he was using anything but the exhibits, but I can't say that he did not use the record, because we were not working together nearly all the time.

Q. As far as you were concerned, you used the exhibits; is that right?

A. As far as I am concerned I used what Mr. Wiggins told me the exhibits stated.

Q. He had the exhibits there?

A. He had the copies of the exhibits, yes.

Q. Do you find any reference to California destinations in Spangler's Exhibit 23?

Exam. ROGERS. Let us ask Mr. Wiggins about that and get it straight, Mr. Spencer. (3730.)

Mr. SPENCER. All right.

Exam. ROGERS. Mr. Wiggins, when you made up your tabulation did you consider the exhibits of the Idaho witnesses only, and Mr. Teutsch's exhibits only, or did you consider the daily transcript of the record along with the exhibits?

Mr. WIGGINS. I haven't had that, but we checked them up and arrived at them in the office down here in connection with the witnesses and with Mr. Thompson, of the Idaho commission.

Exam. ROGERS. Yes, but you have not gone over the record in connection with the exhibits?

A. I have not gone over the transcript in connection with the exhibit. (3731.)

2056 On page 7 of my Exhibit 107 I refer to an exhibit of Mr. Newton but left the exhibit number blank. That should be Newton's Exhibit 7.

Q. (By Mr. SPENCER.) Well, you are testifying with reference to these exhibits as though you had reviewed them and are incorporating them as a basis for your tabulations here. Now did you use those exhibits, or did you get it from Mr. Wiggins?

A. Mr. Wiggins gave me the figures and told me they were taken from these exhibits. I did not review the exhibits myself. At the time Mr. Wiggins and I were making this we didn't have the numbered copies before us. (3732.)

On page 8 of my Exhibit 107, near the bottom of the page where reference is made to "Mr. Wiggins' Exhibit—," that should be Wiggins' Exhibit 28.

Q. (By Mr. SPENCER.) Now, in this last page you are making this computation upon the assumption that all this western Oregon business, southwestern Idaho business and eastern Oregon business is going to move across this line; is that right?

A. Which statement do you refer to?

Q. In your summary on Table 20, on page 7.

A. All the traffic which has been referred to, yes, is going to move across the cross-State line.

Q. If the southwestern Idaho business does not go via that line, or if the western Oregon business does not go, why your estimates would fail?

A. Certainly.

Q. Now you say if there be no compulsory—on page 8 you say, "If there be no compulsory interchange between the carriers at Crescent Lake, a considerable part of the traffic which I have claimed for the new line would be subject to competition between the carriers." I understand you don't claim this yourself as being traffic for the cross-State line?

2057 A. Well, only in the manner indicated.

Q. Yes.

A. That is, based on the statements of the witnesses. (3733.)

Q. Yes. Now you say, "a considerable part of the traffic which I have claimed for the new line would be subject to competition between the carriers." Now what carriers would be competing for western Oregon traffic?

A. The Southern and the Union.

Q. Where would the Great Northern be?

A. Well, they would be there also, as they are now.

Q. The Northern Pacific?

A. Yes.

They are in there now, with their own rails, but their competition would be whatever it is now. The Union Pacific would be a competitor in the Southern Pacific territory. I don't mean that competition in the sense it is ordinarily used as competing railroads serving a territory—it would not be serving a territory. They would not have any more competitive service in western Oregon than they have got now via Portland, but they attempt, I understand, to get some of that traffic now. (3734.)

2058 Redirect examination:

Q. (By Mr. MCCULLOCH.) Refer to Exhibit 106—no, Exhibit 104, of Mr. Wiggins, please. Just referring to the item of hay alone, now suppose in order to obtain an average rate in cents per ton mile to apply to the tonnage moving over the cross-State line, Mr. Wiggins had assumed only San Francisco as a destination, what effect would that have had on the computations and figures he has shown in the last column of his exhibit, and what corresponding effect would that have made on the calculations and results you reached in your Exhibit 107?

A. He would have had a higher rate per ton mile of about, as I recall the figures, one-seventh, would have increased the gross earnings by about that amount of money and the corresponding increase in gross earnings would have been made in the net earnings which I used, so that I would have had larger net earnings to attribute to that line.

If there was any possible element of unfairness in his assumption, or his use of a ton-mile revenue to Los Angeles in the case of all of these commodities, for the purpose of ascertaining an average ton-mile revenue to apply to the tonnage moving over the cross-State line—if there was (3735) an element of unfairness in that, it was not unfairness to the defendants in this case.

Q. Now you were asked some questions about divisions of these joint rates on lumber to eastern territories in comparison with the direct costs of performing the haul to the two carriers that divided the joint rate. Now I think there has been testimony in this case, or there will be, that the rates on lumber from territory west of the Cascade Mountains in Oregon and Washington over a vary large geographical area are blanketed to eastern destinations, like Omaha and Chicago. If the rates are blanketed, if the joint rates are blanketed from such a large area of production and of origin,
2059 would it be practicable, in your opinion, for the railroads to use in dividing that blanketed joint rate anything but a standard or blanket division?

A. Well, that is rather out of the field that I know about. I don't see how else it could be done, except that——

Q. What I was getting at was this: If the rates were blanketed it would seem to be necessary that the division should be standard and uniform, whether the traffic to Omaha or Chicago originated in northern Washington or southern Oregon or Portland or Seattle or Eugene. Now can the direct cost of hauling lumber from all the points of origin west of the Cascade Mountains in Washington and in Oregon to an eastern destination (3736) like Omaha or Chicago, be blanketed? Would there be such a thing as getting a blanket direct cost of haul?

A. No. The costs would be——

Q. From all different origins?

A. The costs would vary with the location.

Q. Would you say, then, Mr. Newell, that it would be a feasible or practicable thing to attempt to maintain a definite relationship between the divisions of joint rates on lumber from all this coast group territory in Oregon and Washington to eastern destinations, on the one hand, and the direct cost of hauling from all of those points of origin to any particular destination in the East?

A. I would not think it would be practicable. I think any arrangement that would be made would at times be unjust to one carrier, and if it were an absolutely unjust division it would be at other times unjust to the other carrier. That factor would have to be taken into account in determining what the divisions should be.

Q. Would it follow, then, Mr. Newell, in your judgment, that a division which, from the standpoint of direct cost of haul to the carriers, involved from Seattle to Omaha on fir lumber, might
2060 not seem equally reasonable and fair, so far as that particular relationship is concerned, if the lumber originated at Eugene or at Klamath Falls and was destined to Omaha? (3737.)

A. There would undoubtedly be differences in those different places. It would not apply with exact equality throughout.

I do not know whether the present division is blanketed all over this territory now, whether the blanket rate applies.

Recross-examination:

Q. (By Mr. Dey.) Just one question. This rate that you have taken to San Francisco and Los Angeles to arrive at a mean here of rate per ton mile, involves $14.00 a ton, as I understand it, on hay. Now then, instead of taking the San Francisco rate and the Los Angeles rate, why didn't you take the hay rates that apply in Oregon, inasmuch as the testimony in this case is that most of this hay, if it is going to move anywhere, is going to move to western Oregon?

A. I don't understand the latter to be the case. This was represented to me from the exhibits and from the statements of the witnesses, that this was going to California. There is nothing on the Spangler exhibit to indicate that. (3738.)

2061 C. E. Day was thereupon produced as a witness on behalf of defendants, and, having been first duly sworn, testified as follows:

Direct examination:

I am office engineer on the staff of the general manager, the Southern Pacific Company, Pacific lines. I finished up my college work in 1905, and I have been working at engineering since that time. I entered the service of the Southern Pacific in 1905, in the engineering department. My employment has not been continuous. Until 1920 I was in the engineering department. From about 1912 I was in the chief engineer's office, and in 1920 I went to China and was there three years, and I returned then to the Southern Pacific. (3740.) I returned to the chief engineer's office in 1923, and then about two years ago I was transferred to the general manager's office. My present duties deal with matters that pertain to the economics of railway operations. My duties under Mr. Hood, the late chief engineer, was related to the economics of railway location and construction, largely. In my present work I make studies of the economics or problems that relate to various phases of operations.

I have made a hurried examination of Exhibit 16 in this case, being a cost study by J. P. Newell, and have made some observations. Generally speaking, that study does not go into the same refinement that I am accustomed to use in similar work. With respect to the features out of line with my idea (3741: Exhibit No. 16, by Wit-

ness J. P. Newell, purports to show that both Southern Pacific and Union Pacific are overlooking an opportunity of making the very profitable investment which is afforded by the proposed cross-State line from Crescent Lake to Eugene.

2062 The conclusions arrived at by Mr. Newell in the application of his cost data to traffic which he proposes to divert from the present routing, or from Southern Pacific lines to Union Pacific lines, is an exaggerated conclusion.

I have not had an opportunity, as stated before, to fully analyze his studies, and have therefore only observed certain important defects.

Mr. Newell's conclusions are over-stated for several reasons, some of the most important ones attached to his treatment of the following:

(a) Division of expenses into direct and indirect;

(b) Fundamental errors in method of deducing cost data; and

(c) Application of average results to specific traffic that does not conform to the average.

These criticisms are more fully explained in the following observations. (3742.)

Referring now to Exhibit 16, Table I, page 26, Mr. Newell sets up a division of the freight proportion of operating expenses into two parts, the first being what he calls direct, and the second part indirect.

The indirect proportion is cast out, so far as this study is concerned. The direct he uses for obtaining his cost data. By having a large percentage of expense retained in the direct proportion he obtains a large unit cost.

Now, the direct expenses as applied by Mr. Newell should reflect only the cost that would be saved by the Southern Pacific through the diversion of traffic to the Union Pacific on the one hand; and on the other hand, should reflect expenses that would be added by the Union Pacific on account of the same traffic being on its line.

2063 Not all of the expenses that attach directly to the movement of trains, even, fluctuate with the traffic density. For example, trainmen's wages, even, do not directly vary with the traffic. There always exists, on an operated railroad, times when increase in traffic will have no effect on wages (3743) paid to trainmen. The average direct cost in this limited sense is always less for added traffic than one hundred per cent of the average cost; and the percentage decreases as the average traffic density decreases.

Mr. Newell has recognized this in his treatment of branch line haul as to certain items, but has not given it the consideration he should in main line haul.

These observations about to be made are directed to the percentages of direct expenses as indicated by the simultaneous fluctuation of the traffic and the fluctuations in cost; except, maintenance of way expenses have not been thus analyzed for the reason that re-

sponses to increased requirements are not immediate, and, therefore, maintenance of way expenses do not lend themselves to this sort of analysis. Also, this analysis has not been extended to all the items of expense because of the limited time at my disposal.

Maintenancy of way expenses have been subjected to very intensive study to determine the allowance for increased use. First, when the United States Railway Administration turned railroads over to the owners, a study was made to adjust for the increased use of property during the war period. This study resulted in a schedule of percentages for each item of expense under this heading. Later, the committee on economics of railway operation of the A. R. E. A. adopted this same schedule in Bulletin 274, year 1925, as the proper measure of increased (3744) use.

2064 I have applied this schedule to the items of expense in Mr. Newell's Table I in Exhibit 16, and find that the amount affected by use to be $752,703.00. Mr. Newell's estimate amounted to $1,021,077.00, or 35.6 per cent more than that recommended by the A. R. E. A.

It is difficult to see how Mr. Newell could reason that the expense should be so high in certain items. Superintendence he divides on basis of all other accounts and thus assumes that superintendence belongs as much to the indirect as to the direct expense.

Since indirect expenses are assumed not to vary, it is reasonable to assume that correspondingly his supervision should not vary on this account.

Mr. Newell assumes 50 per cent variable whereas the A. R. E. A. assumes 20 per cent variable. I would agree with the twenty per cent, approximately.

Mr. Newell assumes shops, enginehouse, and water stations as 80 per cent; the committee assumes 10 per cent. The point is, whether I agree with it or not, there is one body of experts says a certain item should be 10 per cent, and Mr. Newell on that same item says it should be 80 per cent. This schedule of percentages was (3745) obtained in committee or group meetings, and it is the composite judgment of their experiences. I am not able to say whether that situation in expert testimony is unusual or not.

As to maintenance of equipment expense, depreciation, and retirement, Mr. Newell assumes 100 per cent direct. It is reasonable to assume that some of the maintenance, depreciation, and retirement of shop and power-plant machinery is uninfluenced by traffic. The A. R. E. A. committee assumes shop machinery at 40 per cent and power-plant machinery at 5 per cent, in contrast to Mr. Newell's assumption of 100 per cent.

2065 Work equipment, in part at least, is used for making repairs due to other causes than to traffic. At least the maintenance of such work equipment is not to be considered direct.

As to traffic expenses: It is common to think of these expenses as being incidental to the origination and delivery of goods. Since there will be no change in this respect, on diverted traffic, and it is

only a matter of routing same traffic by different routes, the cost of originating traffic by the Southern Pacific should be about the same in either case (3746), and therefore it does not matter much what percentage is taken as direct in this particular.

As to general expenses: Mr. Newell has divided the general expenses between direct and indirect in the proportion that all other expenses are direct or indirect. This assumes that every change in the cost will be reflected by a similar change in the cost of general expenses.

When it is realized that general expenses cover such items as valuation, pensions, legal, and the like, it is difficult to see how they can be made to vary in the direct ratio assumed by Mr. Newell. I have not made a study to determine what percentage is direct in fact.

As to transportation expenses: I have made a more careful study of these expenses, and can not agree with Mr. Newell that 90 per cent of all the transportation expenses are direct and varying in the same ratio as traffic. He assumes that superintendence fluctuates exactly as all other expenses, that is, if any part of the other expenses varies, superintendence varies accordingly.

In order to determine exactly how responsive the cost of superintendence is to changes in traffic density, I have set up the volume of traffic and the cost of superintendence on the main line by months for the year 1927, and by ordinary mathematical rules determined the most probable value of trend in cost as a function of traffic density. (3747.)

2066 I find by this analysis that superintendence is affected by traffic as follows:

Shasta division	4 per cent.
Sacramento division	16 per cent.
Salt Lake division	6 per cent.

as contrasted with Mr. Newell's estimate of 90 per cent.

In a similar treatment of dispatching expense, I find the following percentages affected by traffic:

Shasta division	27 per cent.
Sacramento division	15 per cent.
Salt Lake division	33 per cent.

Mr. Newell assumes 100 per cent in his analysis.

Similarly I find enginehouse expenses to be direct as follows:

Shasta division	6 per cent.
Sacramento division	18 per cent.
Salt Lake division	49 per cent.

Mr. Newell assumes 90 per cent.

Station supplies and expenses, which includes heating, lighting, miscellaneous furnishings, and so forth: I find this has no relation practically to traffic; at least, on two of the divisions studied, I find the cost greater during light traffic periods than during heavy traffic periods.

Mr. Newell assumes 85 per cent as being direct, and, therefore, influenced by traffic. (3748.)

Mr. Newell, in Exhibit 16, Table I, treats telephone and telegraph operation as proportional to all other expenses and is, therefore, made to vary in direct relation as any other expense varies.

I have not had time to make a study of this item; if I did, I feel sure that the result would be found to be a very, very small percentage.

2067 The same is true of other expenses, insurance and injuries to persons, all of which he assumes to vary in a direct relation as all other expenses.

As to train service expense, I have made a similar analysis to see how responsive these costs are to traffic density.

Train service expenses that I refer to include such items as fuel, enginemen's wages, trainmen's wages, train supplies, and locomotive supplies.

I find, as to main line haul, the following results during the year 1927:

The Portland division is 62 per cent; the Shasta division 64 per cent; the Stockton division 92 per cent; the San Joaquin division 91 per cent; and the Salt Lake division 97 per cent.

Sacramento division was not analyzed. If the data were available I would expect that the percentage on the Sacramento division from Gerber to Roseville would approximate that on the (3749) Portland and Shasta divisions; and from Roseville to Sparks, I would expect it to approximate that found on the Salt Lake division.

Mr. Newell has estimated that these expenses on the main line are 100 per cent direct. It is believed that what has been shown herein is sufficient to show that Mr. Newell has grossly overstated the amount of reduction in operating expenses that will be saved to the Southern Pacific on account of the diversion of traffic to another carrier.

Referring now to Mr. Newell's cost data: There seems to be something wrong in the method of Mr. Newell in deducing his cost data. I have not had time to go fully into this, but I have studied his fuel factor. By his method he deduces the cost of fuel to be as follows:

2068 Eugene to Crescent Lake, 1.88 cents per thousand foot tons;

Crescent Lake to Klamath Falls, 1.88 cents per thousand foot tons;

Klamath Falls to Ogden, 1.18 cents per thousand foot tons.

That "cents" shouldn't be on that 1.18. It would be $1.88 per thousand foot tons. $1.88 on the first two and $1.18 on the third one that I gave. That is right. (3750.)

As to whether that is the common basis for basing fuel costs per thousand foot tons: It is a good basis. I use the equivalent of it. I don't put it in that same unit, but I will come to that in a moment.

That is, north of Klamath Falls Mr. Newell uses a cost for fuel that is 70 cents per thousand foot tons, or 60 per cent higher than that which he uses for the territory south of Klamath Falls.

The most modern power owned by the Southern Pacific Company is now being used between Eugene and Klamath Falls, and therefore the cost of fuel consumed should not be any greater than south of Klamath Falls—the amount of fuel should not be any greater.

The Southern Pacific does pay more for fuel at Portland than at California points, the price being about 25 per cent higher; but the change takes place at a point between Eugene and Crescent Lake, and not at Klamath Falls.

The difference in price accounts for 25 per cent of the difference, whereas Mr. Newell has used a difference of 60 per cent. I infer from this that there is a fault in his method of deducing his cost data. (3751.)

Referring now to Mr. Newell's base price of $1.18 and $1.88 per thousand foot tons: Our experience, which I have had many
2069 opportunities to verify, proves that a superheated locomotive of the type generally used on main line through trains consumes 0.34 gallons of fuel oil per horsepower hour. Converting this to the unit of one thousand foot tons and figuring oil at $1.05 per barrel, this amounts to 86 cents per one thousand foot tons; and at $1.30 per barrel amounts to $1.06 per thousand foot tons.

Hence it follows that Mr. Newell's cost for fuel is too great by the following percentages:

Eugene to Crescent Lake, 77 per cent too great.

Crescent Lake to Klamath Falls, 119 per cent too great.

Klamath Falls to Ogden, 37 per cent too great.

As further proof of the inaccuracy of Mr. Newell's figure, I refer to his first computation for the haul Eugene to Crescent Lake, shown on Exhibit 16, page 67.

He shows the resistance cost to amount to $20.61 per car of 56 tons. Of this cost 38 per cent, or $7.80, is represented by the fuel item for hauling a car of 56 tons a distance of 96 miles. This is at the rate of $1.45 per thousand gross ton miles.

A typical performance, as shown by our fuel bureau, indicates (3752) a consumption of 9 gallons per thousand gross ton miles between Eugene and Oakridge and 43 gallons from Oakridge to Crescent Lake, or approximately an average of 23 gallons for the entire distance. At $1.30 per barrel, this amounts to $0.71 per thousand gross ton miles, in comparison with Mr. Newell's estimate of $1.45, which is more than twice as great. Another example of his erroneous data is found in the fuel cost from Roseville to Sparks. His estimate amounts to $6.80 per car, or at the rate of $0.87 per thousand gross ton-miles.

2070 We made eleven test runs without helper, in the month of May, with Southern Pacific type of power, and the average consumption amounted to 24.71 gallons per thousand gross ton miles;

and, at $1.05 per barrel amounts to $.062 per thousand gross ton miles.

Mr. Newell's figure of $.087 is 40 per cent too great.

Doubtless the cost is less in actual practice with the use of helpers and therefore, Mr. Newell's figure is even greater in error than the 40 per cent found by comparing with the performance of a single-engine train in a helper district.

The limited time at my disposal has not permitted me to make further tests of the accuracy of his cost data. (3753.)

C. N. HUGGINS, was thereupon called as a witness on behalf of defendants, and, having first been duly sworn, testified as follows:

Direct examination:

I am vice president of Cobbs & Mitchell Company, manufacturers of lumber. This company carries on its operations in the town known as Valsetz, in the westerly portion of Polk County, Oregon. I am in fact the general manager of this company although we have no office of that type. This mill cuts primarily fir lumber. The capacity of the mill is about 350,000 feet per day; that is two 8-hour shifts. That would be 175,000 on an 8-hour shift. We market this lumber pretty much all over the United States, and also some goes (3755) export. This company has been operating in Oregon since January, 1921. We do not have any tidewater at that mill. We ship by rail for export a certain portion of our lumber, shipping it to Portland. It all leaves the mill by rail.

2071 I went over our shipping records for the last half—about seven months of 1927, taking them just as they came, working backwards until I thought I had gotten far enough. That disclosed that during that period 15 per cent of the total shipments of lumber from the mill came to Portland for water movement.

Our mill is located on the Valley & Siletz Railroad which connects with the Southern Pacific Company at Independence, Oregon. And the same interests that control our lumber company control the Valley & Siletz Railroad. (3756.) We are 41 miles away with our mill from the Southern Pacific. We rely entirely upon the Southern Pacific for our car supply. The location I have stated isn't in the Willamette Valley; it is just over the westerly summit of the Coast Range of mountains at the headwaters of the Siletz River.

As to how we have been routing our lumber that moves to eastern destinations: I perhaps can answer that best by giving the results of this same checking back which I made. I checked back in that way, beginning with December 31st and going backward, without any omissions, for this period of about 7 months, and in that search picking out the competitive eastern points, as I understood them—if I made any mistakes as to competitive points they were immaterial—and it disclosed that we had shipped during that period via the Southern Pacific through Roseville and Ogden to eastern points 473 cars, and via the Portland gateway 115 cars, a percentage of 80 via Ogden and 20 via Portland. (3757.)

In most cases we route our own shipments.

By competitive points I mean points that might have been reached by the Southern Pacific through Roseville or via Portland. By any one of the routes available from Portland—the northern routes or Union Pacific; that is, if it was common to any one of those lines I included it in this list. It included nothing on the northern Pacific at all, nothing on the Union Pacific west of Green
2072 River, and nothing on the Milwaukee on the corresponding area. If it was purely local to that road, I didn't consider it. I tried to select shipments for destinations which might have been routed on equal rates via Portland or via Ogden. The 20 per cent that went through Portland was divided to some extent among all the carriers, the Northern lines, in this country. The junction point of the Valley & Siletz with the Southern Pacific is (3758) Independence, Oregon.

We have the coast basis of rates applicable to our mill, with a one cent arbitrary to eastern points carrying a rate under 51 cents, I believe, is the division. It is intended to cover that differential of one cent on points west of the summit of the Rocky Mountains, broadly speaking.

I am familiar only by hearsay with the proposed cross-State line that is involved in this case, and from having read some in the newspapers. As a shipper of lumber from the Willamette Valley or from western Oregon, I can't say that I have any direct interest in the construction of the line.

Q. Let us assume that it has been built, and the Alturas route (3759) is then open to you, an extra distance of 216 or 217 miles, how would you route your shipments?

A. Conditions remaining as they are—by that I mean that we, billing our lumber largely at the point of delivery, destination, would continue to control the routing—I think it would make no difference. I wouldn't expect to sell an additional carload of lumber.

My company is a member of the West Coast Lumbermen's Association and a member of the Willamette Valley Lumbermen's Association. The Willamette Valley Lumbermen's Association is the one Mr. Magladry is with.

2073 Exam. ROGERS. What did you mean, that the cross-State line wouldn't have any direct interest of yours? Would it have an indirect interest?

A. I had in mind as a possible indirect influence—and that is the only one I had in mind; I was trying to search for some—a demand from the buyer of this lumber so pronounced that we would yield to it and ship via that route. That demand now is nonexistent. In probably 99 per cent of our sales there is no request particularly for any routing, except for the (3760) delivery line when they happen to be on the switches of some delivery line. I, of course, can not answer the question whether there would be a demand to route that way if we had the line. I would hardly think so. I simply point to the record here and show that in the presence of a shorter

line via Portland—I don't know what the difference is, but it is shorter—we have shipped in this manner, 80 per cent via Ogden. We have had requests from one shipper that I can call to mind—not a general request, but in the case of some orders—to ship them via Portland. That is the only one that I recall, possibly ordering, maybe, an average of one or two carloads a month. No reason was given for wanting us to ship it by way of Portland. I don't know whether it was because the shipper wanted quicker delivery, or for some other reason.

Q. The set-up in this case made by the complainant contemplates, (3761) we will assume, that your business which you furnish the Southern Pacific now, and which the other shippers similarly situated furnish the Southern Pacific, in western Oregon, shall be diverted at Crescent Lake and the Southern Pacific Company short-hauled.

Can you see anything in this entire situation that would
2074 lead you as shipper, a substantial shipper, to short-haul the Southern Pacific Company in the future any more than you have in the past, by using the cross-State line?

A. I can see no reason.

Q. I think you stated that the question of the time had not been raised by your trade?

A. I don't recall of any at all.

Q. Well, do you think in your experience, Mr. Huggins, that a difference of 215 or 216 miles in a haul across the continent has anything in it that would act as an inducement to you, or shippers similarly situated, to divert the long-haul from the carrier which serves your mill?

A. I don't think it should have the slightest effect.

The Southern Pacific has never attempted by any undue influence of any kind to interfere with us, or has it ever done so, in the routing of our shipments.

As to whether the lumber industry here in the fir belt in western Oregon has been prosperous for the last few years (3762); I would say generally that at no time since our mill was completed in the fall of 1920 have we ever produced the capacity output of the mill, simply because of our inability to sell it. Our actual productions—the present capacity is 350,000 feet a day or two 8-hour shifts—that is the capacity now, and has been for the past year and a half. In the earlier days we were down—in 1920, when the mill was first put in operation, we calculated the capacity as 250,000 feet per day of two 8-hour shifts. By process of additional facilities the capacity of the mill was gradually increased, and for the past year and a half it has been 350,000 feet per day. I use the two-shift figure because of the fact that we are built and equipped for a two-shift operation. Our dry-kilns take care of two shifts, our logging equipment is for two shifts; our planing mill in one shift takes care of two shifts of sawing.

2075 Our production in 1921, with a capacity as we rated it then of 250,000 feet per day, or, say, 75,000,000 feet a year, was, in round figures, 33,000,000 feet;

In 1922 our production was 36,000,000 feet; in 1923, 56,000,000 feet; in 1924, 52,000,000 feet; in 1925, 49,000,000 feet (3763); in 1926, 62,000,000 feet; and in 1927, 60,000,000 feet.

At no time have we been able to sell all the lumber cut and that we would like to have produced.

My previous answers would indicate that I entirely disagree with now to what we class as the small mills of the Willamette Valley. Valley Association going east would be routed via the cross-State line. I have no judgment as to the mills, or the class of mills which I think Mr. Magladry had in mind in testifying. I am referring now to what we class as the small mills of the Willamette Valley. The major membership in this Willamette Valley Association is now made up of a group of perhaps 25 or more of these so-called small mills. I think he had in his mind—this is only a supposition—that he was speaking for that class of mills, and not for the larger mills, of which ours is one. (3764.) I don't believe I am competent to answer whether there would be a different situation as to small mills and large mills, because I admit that I don't know where they find their business—to what part of the country they are shipping, and what class of customers. They sell to the brokers and wholesalers.

2076 Cross-examination:

I attended the meeting of the board of directors, of which I am a member, of the Willamette Valley Lumbermen's Association in the Marion Hotel at Salem when the matter of the cross-State line was discussed. I did not attend a meeting of the entire membership at any time when the matter was discussed and voted on. I was notified of such a meeting. I don't know just what meeting that was. At the meeting of the directors which I attended a resolution was adopted the purport (3765) of which was that the association was to present witnesses at this hearing. The matter was deferred until it could be presented to the entire membership; it was merely a recommendation, to be acted upon subsequently by the membership.

The Valley & Siletz Railroad which our company operates is a common carrier. Our company made no effort to get the (3766) Southern Pacific Company or any other railroad company to extend into our timber before we embarked upon the common carrier railroad enterprise which we are now engaged in. I want to correct my answer to the former question. The company does not operate the Valley & Siletz Railroad. The affiliated interests own and operate that railroad. It is operated under a separate name, but controlled by the same interests.

We have joint rates with the Southern Pacific and other transcontinental lines on our lumber.

As to the principal eastern market for our lumber, we ship to the East as far as central New York and, generally speaking, from there over the entire stretch of country to the West, to the Rocky Mountains. Our largest business, regular business, is in the States west of the Illinois-Indiana line. Our company does not operate lumber yards there. Our affiliated companies or interests do not oper-
2077 ate yards in that territory. (3767.) We do not operate any yards anywhere in the East; the only yard we operate is a small yard at Salem, Oregon.

As to why I say our company wouldn't route much if any of its traffic over the cross-State line, assuming that it is to be a shorter line than the existing route by more than 400 miles, the present reasons which control our routing would probably prevail just the same. Those present reasons that control the routing are these: The Southern Pacific is the only line with which we connect, the only line which performs, can perform, any service for us particularly. They do business with us, and we do business with them. If we had another common carrier railroad available or within reach of our plant, I don't think that would change our attitude as to routing, unless we had a connection with it from our own rails. (3768.)

I don't think the Oregon-Washington Railroad & Navigation Company, or any Union Pacific traffic official, has solicited us for the routing of business through the Portland gateway during the last year or two—they have not made any special solicitation. Their traffic men come around, as do all the railroads', and make a visit. We never have had any special request from them, though, for the routing of business through the Portland gateway.

Q. Why have you increased the capacity of your mill to such a substantial extent, if the lumber market has been as discouraging as you say it has been?

A. Because by so doing we decreased our unit costs of manufacture.

Q. You inferred that there might be some indirect or incidental benefit from the construction of the line, but that there would be no direct benefit. Would you care to explain a little clearer what you mean, or what you intended to infer, by your answer in that respect?

2078 A. I don't know whether I can. I have already said that we route our own shipments in probably 99 cases out of 100. I was trying to conjure in my mind some situation where a buyer of our lumber might take it upon himself to endeavor to secure from us routings over this new line. That is the only thing that I had in mind.

Q. Would he be liable to do that, in the event he wanted prompt delivery?

A. I don't see how I can answer that question.

Q. You don't know what would influence him. Well, would you (3769) expect to gain any indirect benefit through the general de-

velopment of the State which might result from the construction of the cross-State line?

A. I wouldn't expect to.

Q. Do you know any reason why your company would not participate in any benefit which would accrue from increased development in the State as a whole?

A. I would think it might benefit only to the extent that the increased use of lumber throughout the territory which we serve was measured. (3770.)

Q. Have you any fear that that general benefit might be offset by increased production of lumber stimulated by the construction of this line?

A. I have no knowledge whatever of any plans there might be for the marketing of any lumber reached by that line. I can, therefore, only answer generally that any increase in the production of fir lumber in this district would be anything but beneficial.

Mr. DEY. Beneficial to whom?

A. To the manufacturers of the lumber and the owners of the timber.

2079 Our company shipped in 1927 about 1,500 cars; in other words, 62,000,000 feet of lumber. Of those 1,500 cars about 50 per cent moved east, that is to points east of Ogden or Granger, or corresponding points on one of the northern lines. That does not include shipments into Texas, for instance. I am speaking of what we class as east. (3771.) We do have some business, of course, in Illinois, and ship some to Chicago. I haven't accurately in my mind information as to the approximate time in transit from our mill at Valsetz to Chicago. Of course, it is in our office. But I would say—and this is perhaps a guess to the extent of one or two days—I would say 12 to 14 days.

Q. Mr. Huggins, in recent years has there been—and when I say recent years, the last 5 or 6 or 7 years—any change in the practices of eastern consumers of lumber, and I mean by that particularly the owners of retail yards, retail lumbermen in the East, in buying lumber, in the amounts they buy and in the quicker deliveries that they specify, than used to be the condition 8 or 10 or 12 or more years ago?

A. From the retail yards our orders are more frequent and for smaller quantities; what I mean to say is there will be one car instead of two, perhaps.

Q. Has the change essentially been this in recent years: That so far as retail yard consumers are concerned they have been carrying smaller stocks themselves and have been ordering more frequently and letting the manufacturers keep the stocks and they just buy a car as they need it? (3772.)

A. That is undeniably true.

Q. Do the orders your company gets from retail yards for cars of lumber ordinarily specify the time within which delivery is to be made?

A. No; it is not usual. They will use the ordinary trade terms of "prompt," or "immediately," but rarely do they specify an exact date. They quite often specify immediately. We understand
2080 that to mean within about 10 days. That is the shipment is to be started from the mill within 10 days from the receipt of the order.

Q. (By Mr. McCULLOCH.) Has not, in view of this change in the practice of retail yards in buying and in specifying quite frequently immediate shipment, made time of transit and saving in distance considerably more important now than it was 8 or 10 years ago in the marketing of lumber?

A. Well, this change in the practice has been undoubtedly brought about, in a measure, at least, by the greater rapidity of transit. (3773.)

I said that 80 per cent of our shipments to the East are routed via Roseville and 20 per cent via Portland. I think that would be fairly true of one or two or three years' business. If I knew that it were a fact that the Southern Pacific Company would make just as much money on a car of lumber, say, to Omaha, whether we routed it via Roseville or via cross-State line, if that was built, I don't think I would have any particular choice as to route, then, under those circumstances. There are a few instances in which our company must observe routing requests or instructions from our customers.

Exam. ROGERS. Mr. Huggins, I would like to ask you this: As I get this discussion about the lumber dealer in the East and the shorter distance and time, it boils down to a question of whether the difference of a couple of days in the delivery of the car to the dealer in the East is a matter of great importance or minor importance? (3774.)

A. I would think, from our own experience and our own practice, that it was not a matter of one or two days that was of such great importance to him as it was a matter of comparative time in transit now to what it was several years ago, before this practice was changed.

Exam. ROGERS. What was it several years ago?

A. Oh, we used to figure on 30 days, 25 to 30 days. They have cut it in half.

2081 Redirect examination.

I honestly don't think a new route that allowed us to save a couple of days under what it now takes, would make any difference in our method of doing business, method of routing, in our judgment, in the light of our past experience. I don't think we would be concerned.

Recross-examination:

Our Valley & Siletz Railroad began operation as a common carrier January 1, 1918. We did not have joint rates on the coast group basis from the time our road went into operation. (3775.) I be-

lieve it is a fact that we were compelled to institute proceedings and prosecute them before the Interstate Commerce Commission to obtain joint rates on the coast group basis before we got them.

As to whether the line shown in brown on Exhibit 100, from Independence out to near Kings Valley, is the location of our mill on this map: It extends up, takes an upward turn there until it is almost directly west of Independence. There is an extension that has been built on. It does not show in this map because the map is not correct. It is not complete. It does not go down the full length of our line. That is the location. (3776.)

2082 J. O. ELROD was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am engaged in the lumber business in Oregon. The name of our company is the Umpqua Mill & Timber Company, and is located at Reedsport, about 20 miles north of Coos Bay.

Q. Can you show the commissioner on this map about where your mill is, Exhibit 100? That is the Coos Bay line down there [indicating].

A. What is this [indicating]? This is Reedsport?

Q. Yes; right there.

A. Winchester Bay.

Q. About opposite the words "Winchester Bay" on the left hand side of the map?

A. Yes, sir.

Q. And located on what river?

A. The Umpqua and Smith River.

As to whether we ship out of there by water, directly or indirectly (3777): Very little water shipment; mostly rail. Probably 20 per cent by water. As to how our water shipments move: Part of the time there is a small boat right at the mill, and the rest of the time we ship to Coos Bay.

We ship some lumber east by rail. And that lumber is moved by the Southern Pacific through Ogden, largely. We allow the railroad company that serves us to have the preference on the routing; we try to route everything on the originating line.

The capacity of our mill is 150,000 feet, eight hours. We manufacture some spruce, mostly fir. We have not been able to operate to capacity on the market during the past few years because prices are so low they don't justify it. (3778.)

2083 We have interests in other parts of the State.

I think I have a pretty fair knowledge of the western Oregon timber belt.

In my judgment, I don't think the construction of the cross-State line would affect the timber owners of western Oregon at all in enabling them to hasten the marketing of their product.

We need either an increased demand for the use of lumber or less production. An increased price is what we need.

We have been able to get into all of the markets that we want to get into with our present transportation facilities. We haven't had any difficulties.

As to what my judgment is as to whether the timber belt, this natural resource of western Oregon, should be rapidly mowed down, or whether the production should be held (3779) back so that the industry may get on a profit-making basis: There is not any question but what it should be held back. There is not any question but what we are overproducing. (3780.)

I do not see any advantage to the lumbermen of western Oregon in the construction of this proposed cross-State line.

As to how far do they haul logs in Oregon now: That is a pretty hard question to answer. They are hauling logs longer than they used to. Each year the forest is moving back.

Q. What is the tendency with respect to the increase or decrease of milling on tidewater?

A. Well, the tendency is increasing on tidewater. That involves a constantly increasing log haul.

I think there are some log hauls of 100 miles. I don't know whether I could just tell—that is, I don't know just how far, but they are hauling a good deal longer. They are hauling logs farther up north than they are here.

2084 I do not look to see any further large investments in manufacturing plants in the woods removed from tidewater. (3781.)

Cross-examination:

We have a port down at Reedsport where we are attempting to develop our harbor facilities. I have taken quite a little interest in the development of that port. As to whether I could see any advantage from the construction of this cross-State line if it had the effect of ultimately bringing the Union Pacific to tidewater either at Reedsport of Coos Bay, it is possible there might be some. I figure that would depend a good deal on how extensive the port is developed. In other words, if the port ever got to be deep enough water so that large trans-Atlantic ships came in there, then there might be some tonnage got there. We do not look for that, however, in the near future. We expect to have a harbor there that will take care of (3782) coastwise business. I would doubt whether it would result in any benefit to the Coos Bay harbor, where the larger ships do come in. I think Portland would, for all that kind of shipment, probably be the controlling factor, in my judgment. I think it likely Portland would get the shipping regardless of the transportation or harbor facilities that were available. I am not posing as an expert. That is just my opinion. Portland has its docks and is entranched in its business. The boat lines come to Portland, and I think it would be very hard for any small place to affect a city that has the shipping Portland has.

Q. Well, if they had the facilities, isn't it reasonable to assume that they would get a part of the business?

A. Well, they might. I don't know. But at Flavel down here on the Columbia River it was tried and it never diverted very much.

The Hill people had boat lines and a great many things there a few years ago, but it didn't seem to affect us much here.

2085 Q. Did they have more than one railroad serving Flavel? (3783.)

A. No; I don't know as they did.

I think probably the principal market for our lumber production would be Texas and southern California. We ship some all over the United States, but our principal markets are in that district. We are not a great deal interested in reaching the Middle West. We do some. I could not tell you what percentage is marketed in California. Mr. Wells, my partner, handles the details of that, but I would think 30 per cent by rail in California and probably 20 to 30 per cent by water, and the balance is scattered over the United States. We do not ship a great deal to the Middle West. We have never attempted to develop those markets, ship more of our product there than we are shipping at the present time; we have not tried to develop any market. We try to sell where the best market is available. (3784.) As to whether I think that the place where we sell our lumber, or the greatest portion of it, at the present time, is affected by our railroads and the direction that they take us to, or that it is affected by the lack of railroads, I don't think so; no.

We are not operating our mill to capacity at the present time. As to whether we have increased our output any during the past 2 or 3 years, we have a new mill there. We have owned our timber in there a great many years, but we have just started to developed the mill. We built the mill about 3 years ago. Last year we operated the mill on (3785) two shifts about half of the year, and one shift the balance of the year. This year we will only operate one shift, and we will only operate about half of the time. In fact, we are shut down now.

The condition of the lumber market when we constructed the mill is better than it is now. It didn't look so very good then. What

2086 fundamental factor caused us to construct the mill in times of poor market is a rather hard question to answer without going into a lot of details. (3786.) I haven't any particular reason. Three or four years ago the majority of us thought we were going to come into a better market, but we didn't do it. We owned a lot of timber down there and our taxes have increased from a very nominal sum to very large sums, and financially we didn't feel that we could afford to keep on paying out of our resources taxes on this timber. If we had thought the market was going to be what it has been, nobody would have built a mill. (3787.) There had not been very much deterioration in our timber that caused us to want to market it. The timber in that country is not overripe timber. As to whether it is true that there is a great amount of timber in western Oregon that is overripe and is deteriorating rapidly, there is in all timber to some extent. I think that is a very much overexaggerated theory. It is probably true that there are a great many timber owners who really feel that they are suffering from the bur-

den of carrying heavy taxes on their timber over a long period of years and who feel that they must be allowed to market their timber in some way; I don't know. I can't see how the construction of this line would hasten the marketing of western Oregon lumber or affect the western Oregon lumbermen in any way at all. The State of Washington, with 3 or 4 transcontinental railroads serving it east and west, has been marketing much faster than the Oregon timber, but I don't think the railroads had half as much to do with it as their water transportation. (3788.) Possibly the railroad transportation had something to do with it.

Q. You are advocating that the production of lumber be held back as much as possible. Now I am wondering whether you want that retarding influence to be used altogether in the State of Oregon, or whether you are speaking for the entire producing area?

2087 A. Well, I am saying that is what should be done in the entire producing area, of course.

Q. Is there any reason that you know of why all of that retarding should be done at the expense of the Oregon lumber owners, who have been paying taxes on their timber for all these years?

A. Well, I don't think it has. I think Oregon is doing less than most other places at the present time. That is my opinion, without having the data. By "doing less" I mean less of curtailment. I do not mean cutting less timber. I mean they have less of the cooperation to curtail. I think many other districts are doing better than Oregon in the matter of curtailment. (3789.) As to how I reconcile that statement with the fact that Washington is cutting about 7,000,000,000 feet a year as compared with Oregon's 4,000,000,000, Washington's capacity, probably, if you take their maximum capacity with their present production—it is a matter of opinion that I haven't checked up—but it would be my opinion if you took the maximum production of Washington and took what they are producing today, there will be a much greater percentage less of their capacity than a similar comparison between the maximum capacity production of Oregon and the present production of Oregon.

Q. The Long-Bell mill down here recently constructed at Longview has not retarded the Washington production very much, has it?

A. I think they have.

Q. You think that has retarded the Washington production?

A. Well, that has increased it, but I think they have taken off recently a shift; in fact, I know they have.

I don't call to mind any 100-mile log hauls in western Oregon. They are probably doing it, but I don't know just where. We do not haul logs to our mill on the railroad. (3790.) We have a very short road to put them in the river and tow them down. We are hauling logs from out west here at Carlton on the Southern Pacific to

2088 Portland. I don't know how far that is by rail but by air line it is about 35 or 40 miles.

We are not a member of any of the lumbermen's associations. We have a new mill and we haven't joined, though we cooperate with them.

Q. Do you want to be understood as testifying here that you can see no benefit to western Oregon to result from the construction of the cross-State line?

A. That wasn't the question you asked me.

Q. Well, what was the question?

A. You said to western Oregon lumbermen.

Q. That was the way you understood the question?

A. Western Oregon lumbermen. I said no, I could see no benefit.

Q. Well, can you see any benefit to western Oregon as a whole. (3791.)

A. Well, I don't know enough about this railroad and the country it opens up to say, but I can't see where there is any. There might be some benefit. It is probably impossible to make any improvements that might not be of some benefit in some particular lines. If it opens up timber, which I don't know whether it does or not, I would say that would be decidedly bad policy for Oregon.

Q. (By Mr. ELLIS.) But you admit that it would—you will admit, will you not, that it would be of some benefit to timber owners who, by reason of having overripe timber or being subject to fire hazards or the destruction of timber by pests and through tax burdens, might be benefited by additional railroad construction?

A. Possibly, yes. I don't know. I don't know that at all.

I don't know whether there is any such timber land along the proposed route; I don't know the location even. I just know there is talk of a road going through there; that is all I know. (3792.) I haven't any special information one way or the other concerning it.

2089 I could not tell you how many cars our company shipped by rail in 1927. I could tell you in feet approximately. We cut in 1927 about 36,000,000 feet, and I can't tell you, only approximately, how much we shipped by water, but I think we shipped in 1927 probably 40 per cent by water—more than we ordinarily ship. To California, that was. The balance went by rail. It would be purely a guess for me to state what percentage of our rail shipments moved east of Ogden or Granger. I didn't look that up. My idea is it was approximately 20 per cent. I could not tell you whether we shipped any to Chicago. Very little, if any.

On our shipments east we try to favor the Southern Pacific as much as possible. (3793.) I don't think we route our shipments ourselves, that is, insert our routings in the bill of lading; generally we do not. I think mostly we leave them unrouted and merely specify the destination. I presume our company gets orders for lumber from eastern buyers in which a particular routing is specified or requested. As I said, I don't handle the orders, but that happens occasionally, of course. But, as a general plan, I think not.

Our rates from our mill at Reedsport on lumber to eastern destinations are in most territories the same as those that apply from Portland and Eugene and points in the Willamette Valley generally.

Wherever we ship it they are. But in some places we have a differential. But to all points like Denver, Omaha, and all points east they are the same. I don't know whether we have ever made any shipments from Reedsport to eastern destinations via Portland; I presume some. I know that our rates apply via Portland to the East as well as via Roseville (3794), on the same basis. (3795.)

Very often one of the conditions in orders we get for rail shipments is one calling for immediate shipment.

2090 Q. Now you expressed the opinion that the production of lumber, fir lumber here in western Oregon, ought to be held back. Did you have any idea in testifying here that if this proposed cross-State line should not be built, that that would have some effect on holding back the production of fir lumber in Oregon?

A. That would not affect my testimony at all.

Q. (By Mr. McCULLOCH.) You didn't have such idea as that in mind?

A. No; I didn't. I have the impression it will open up very little timber, but that may be erroneous, as far as that is concerned.

Q. Do you have the idea that the construction of the cross-State line, if it were built and put in operation, would stimulate the production of lumber in Oregon?

A. I don't know. I have an idea it would not affect it, unless it opens up new timber. (3796.)

Q. Well then, as I understand your testimony, you did not figure that the construction and operation of the cross-State line would either hold back the production of lumber in Oregon or stimulate it?

A. No; not unless it opens up other timber, I don't think that would affect our western Oregon mills one way or the other.

Q. How did you happen to be interested to testify at all here, then?

A. I wasn't. They wanted my opinion. Mr. Dey asked me to come up, and I did. Mr. Dey phoned me and asked me if I would not come up. I told him I would. That is all I know about it. And the only talk I had with Mr. Dey was about a minute over the phone.

2091 I don't know whether an increase in the rates on lumber to eastern destinations would certainly hold back the production. (3797.) We have had an increase in rates, and production was not held back. I don't think it would be beneficial to hold back production by any such means as that. (3798.)

It would usually be beneficial, other things being equal, for a lumber manufacturer to have his mill at a point where there are two or more railroads serving him instead of one. It is true that in the Pacific Northwest the large lumber milling operations have concentrated at points where there was the greatest amount of competitive rail service available. Portland, Tacoma, Seattle, Spokane—that is true. However, I think there are other things that

have contributed to that location, which I think is tidewater. I think boat shipping and deep water has had (3799) more to do with that than just the fact there were two railroads there.

2092 C. D. JOHNSON was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am engaged in manufacturing lumber. We have mills in Lincoln County; at Toledo, Lincoln County, Oregon. The name of the company is the Pacific Spruce Corporation, of which I am the president. I am very active in the management of it.

The capacity of our mill is 50,000 feet an hour. (3800.) We have run sixteen hours a day; we are now running eight. That is a capacity of 400,000 feet on an eight-hour shift. We are running to capacity as far as an eight-hour shift is concerned. We are only running what we class ourselves as one-half capacity. We are set up for a two-shift operation.

We bought that property down there at Toledo in 1922, commenced construction in 1922.

We are located on tidewater as well as upon rail. On the Yaquina River. We are not on the bay. We are on the Southern Pacific Company's Yaquina branch railroad (3801), which runs out from Albany, Oregon, from the main line.

Q. To the coast; and your mill is located approximately opposite the words "Yaquina Bay" on the left hand side of Exhibit 100?

A. About four miles as the bird flies to the ocean.

We ship about 40 per cent of our output by water and about 60 per cent by rail. As to what territories we serve by rail: We serve the Middle West. Practically all of our product that goes by rail is sold east of Denver, east of the Rocky Mountains. The first business we do is in Kansas. We route our shipments Southern Pacific. I know that there is a shorter route through the Portland gateway, in which the Union Pacific lines or the Northern lines could participate.

2093 Our shipments move through Roseville, I believe you call it, this side of Davis, in California. (3802.) Then through Ogden. We always route our shipments that way. As to whether our customers ever ask us to route a certain way: I don't remember, but we don't—as a policy, we route our own lumber. The only time we comply with the customer's request is that he wants a certain delivery. If he is on the Chicago & Alton Railroad with his yards, and he wanted delivery by the Alton, why, we give it to him. He may be on the Alton, or the Wabash, or some other railroad, and he may have his yard located on one of those lines and want that sort of a delivery. We give him the deliverying carrier that he asks for. Otherwise we route our own shipments.

I am only familiar in a general way with the proposed cross-State line which in this proceeding an attempt is being made to require

one or more railroads to build across central Oregon—what I see in the papers and hear people talking about it a little. (3803.) As I understand it, they are asking for a line to be built from a connection with the Southern Pacific across to a place some place on the Union Pacific called Ontario; I don't know the exact connection; about 200 miles, I think, across the desert. As I understand it, it is to tap the Southern Pacific a few miles north of its connection with Klamath Falls. In a general way I am familiar with the Southern Pacific Company's Alturas route, which is being built. I understand that is to be an extension of what is known as the Natron cut-off through to a point west of Ogden in the State of Nevada.

Q. (By Mr. DEY.) Now, let us assume, Mr. Johnson, that the Alturas line of the Southern Pacific Company is completed,
2094 that it is an accomplished fact, go on that assumption; then assume also that this cross-State line they talk about is also an accomplished fact and in operation; that the cross-State line is 215 or 216 miles shorter than the Southern Pacific Company's Alturas line; is there anything in that situation (3804) that you can see that would cause you to change your past practice of giving the long haul of your business to the Southern Pacific?

A. No, nothing whatsoever.

As to this 215 or 216 miles shorter distance: Lumber, as a rule, is not wanted in a tremendous rush, and the people we do business with carry a reasonable stock of lumber, and I don't think a day or two—I doubt if that would make any difference in the time because our shipments move promptly now. We move lumber to Decatur, Illinois, or Quincy, Illinois, or Bloomington, Illinois, in about 12 to 14 days it goes through, and to Toledo. Clear around by Roseville. We have never had the question raised by our customers as to whether or not we could make a day or two earlier time by using some other route, or something of that sort. I am more or less familiar with the situation over in western Washington. I don't think the lumbermen over there are any more prosperous than they have been here in Oregon the last several years (3805) about the same. The reason I would give for the more rapid cutting of the Washington timber belt than has taken place in the Oregon timber belt is that the production in Oregon is practically all on tidewater, all on deep water. I mean Washington, Puget Sound and Grays Harbor. And, if you look at the map of that country you will see it takes in a good deal of territory; and the timber grew right around Puget Sound and Grays Harbor. About 90 per cent of all the lumber manufactured in Grays Harbor goes out by water.

2095 We have had a great deal of inbound freight when we were under construction. Locomotives came from the Baldwin Locomotive Company, Philadelphia. That came by Southern Pacific. I am not sure whether we routed through New Orleans or Ogden. We tried to give the Southern Pacific the longest haul.

We have operated in the lumber business for a good many years. (3806.) Besides Oregon we have had mills in Texas, Louisiana, Arkansas on the Iron Mountain; on the Southern Pacific at Nacogdoches, Texas; on the Iron Mountain at Huttig, Arkansas; on the Cotton Belt at Alden Bridge, Louisiana; Kansas City Southern. Our practice down there with respect to routing shipments was no different than what it has been here with respect to the carrier that served us. If the carrier gave us the cars and the service we gave them the long haul.

I am a member of the West Coast Lumbermen's Association but not of the Willamette Valley Association. I don't think the Willamette Valley Association is confined to rail shippers exclusively because we have been invited to join the association, but we haven't seen fit to join. (3807.)

Cross-examination:

Q. (By Mr. ELLIS.) Mr. Johnson, what was the fundamental reason which prompted you to locate your mill at Toledo?

A. Well, we bought a property down there that was started by the Government, was one reason.

Q. Well, what was the nature of the Government project that you bought?

A. Well, they started an operation down there and built about 25 miles of railroad and about a billion feet of timber and commenced the construction of this plant for the purpose of supplying airplane material for the allied governments during the war.
2096 That particular stand was about half spruce and half fir. But the present holdings of the Pacific spruce are largely fir.

Q. Well, is it correct to say that the principal reason for your locating there was the fact that you were able to buy a large body of timber with a railroad already constructed, with a sawmill partly constructed, and with boats and other facilities available?

A. Well, the plant wasn't constructed. We constructed the plant mainly. It had been started and the machinery was bought. (3808.) We constructed the plant, and there were no boats. The boats that we own, we bought them. We didn't get the boats with the rest of the plant.

Q. But is it not true that the primary reason for your location there was the fact that the Government was disposing of a large tract of timber with a railroad constructed, and with a mill partly constructed, and you were able to buy this large body of timber and other equipment at a fairly reasonable figure?

A. Oh, well, I suppose that had something to do with it, but I had prior to that time sold my interests in the South and was looking for a location and landed in that part of the country. Not any of that timber was in such a condition that it had to be manufactured to prevent deterioration. It was all in good condition. (3809.)

I think if we had been starting right from the beginning to install a sawmill under normal conditions, we would have located it at

Toledo. As to whether I think the peculiar conditions which confronted us would not have changed that situation at all, I don't know of any better location, unless it is some point where they have deep water, deeper water than we have over the Yaquina bar. (3810.) There used to be great advantages in a point served by more than one railroad, but there is not so much any more. At one time we owned a plant situated on only one railroad.

2097 Q. Has it been your practice to select manufacturing points served by only one railroad, or do you usually try to get competition in railroad service?

A. Well, we usually select a place on account of the timber. Transportation is an important thing, but you will look after the timber, the raw material. That is the main thing about selecting an operation for the lumber business. If you have more than one railroad there might be an advantage in it, there might not.

We operate our own boats. We take the lumber from our mills by our boats, mainly to California. California is tributary to us on a low rate for freight, and we send largely low grade lumber to California. It is a good market for certain kinds of lumber. It is very largely low-grade lumber that we ship by water. (3811.) And practically all of our better grades of lumber move by rail. The market for that better grade of lumber is pretty widely distributed. It goes to various places, in New England, Ohio, Indiana, Illinois, Iowa, Minnesota, Kansas, and Nebraska. We route practically all of this by the Ogden gateway. We select the Ogden gateway as against the Portland gateway because the Portland gateway to us would be an unnatural route. That would be what might be called short-hauling the line we are located on. That was the factor that has influenced us in routing via Ogden. I don't think we have ever been solicited by the Union Pacific to route our lumber through the Portland gateway.

Q. Well, if the construction of a cross-State line shortens the distance to the markets of the Middle West and East by approximately 400 miles, and it is so arranged that the (3812) Southern Pacific Company gets as much earning out of it as it does now, would you have any object to routing via Crescent and the cross-State line?

2098 A. I would have no objections to routing it any way that would be satisfactory to the line I was located on. The thing we are interested in is not taking any undue advantage, or doing anything that would injure the line that we are dependent on largely for service. It is a fact that most of the routing is done by the railroad agent at point of origin and that we give him the destination and delivering line, and he does the rest. We put on the bills of lading—we make the bills of lading in our offices of the routing. Orders are written up that way. All junction points are specified, routed clear through to destination. We make the bills of lading and give them to the agent. We have a traffic manager who looks after that very sort of thing.

As to what I know personally about the prosperity of the Washington lumbermen (3813), there has been no prosperity in the fir industry for four years, either in Washington or Oregon. In making the statement that I did about the prosperity, or lack of prosperity, of the Washington lumbermen, I didn't mean to imply that I had direct information concerning their profits or losses—I don't know, but that is so well understood among the industry that that is hardly debatable. I am speaking in a general way. There might be some people making money but in a general way it is so well understood among the manufacturers of lumber themselves, that it is not debatable.

Q. (By Mr. ELLIS.) Well, have you made any investigation to see whether the Washington lumbermen, as a whole, were making any more or less money than the Willamette Valley lumbermen, the smaller mills located on the Southern Pacific?

A. All this lumber is in competition, and it is all on about the same basis. Some institutions might have some advantages over others, cheaper logging, a better quality of timber, or something of that sort. It all takes the same rate. Lumber manufactured in Washington and Oregon all take the same rate, both by water and rail. (3814.)

2099 Q. How do you account for the fact that 90 per cent of the Grays Harbor lumber moves by water in contrast to your testimony that only 40 per cent of yours moves by water?

A. Well, they constructed their plants there some several years ago. They have been in Grays Harbor a long time, and they built their plants and built up their lines of business on that basis. There is a difference in the types of lumber that are manufactured there and at our plant. We are in position to refine our lumber, and some of the plants located at what is known as a cargo mill are not equipped to refine their lumber. In other words, they ship raw material, but they ship Jap squares to Japan. Well, that is raw material in reality that is taken over there and re-manufactured over in foreign countries. As to whether their situation would be entirely different than the situation of the western Oregon lumberman who is looking to the Middle West largely for his market, they don't cater to the rail trade as much as mills that are located in the interior. A mill that is located in the interior as a rule caters largely to the rail trade.

In 1927 our company shipped about 4,000 cars to all destinations. (3815.) Practically all of them went east to points east of Ogden or Granger, Wyoming.

In shipping to the Atlantic coast we ship there by water. But if we are shipping to some place in the interior, a high-grade lumber, that goes by rail. It would take a car three weeks to get to New England by rail. It takes 10 or 12 days to Chicago. (3816.) I should say a car going to Bloomington, Ill., would take about the same time as a car would go to Chicago. (3817.)

I don't remember any orders received from eastern customers that specify or request the routing via the Union Pacific system lines.

If we got such an order, we would not acquiesce, unless they had some particular reason. There would have to be some good reason for it.

2100 As to whether in recent years I have observed any change in the buying of lumber by a retail lumberman in the East in comparison with their practices of a number of years ago, 8 or 10 or 12 years ago, the tendency of retail merchants is to carry less stock on hand. For instance, the customers that used to buy a hundred cars of lumber at a time now buy ten or fifteen. We frequently get orders for a single car at a time. (3818.)

A great deal of our business is done by telegraph; they wire us for a price on this lumber and "How quick can you ship?"

Q. Now in selling your lumber, this 4,000 cars a year, practically all east of Kansas, that moves by rail, in distributing that lumber are you in competition on any of the items with lumber from competing districts of production in the United States?

A. We are in competition on some item from nearly every producing district.

Q. What are some of the principal producing districts in which your company and the lumber mills of western Oregon come into competition in eastern markets in selling their products?

A. We come in competition with yellow pine from the Southern States; we come in competition, on some items, with western pine from California, pondosa pine from the Inland Empire. There is some timber in Minnesota yet. We come in competition with that.

Q. Now, with the exception of the western and white pine in California, and the pine of Oregon and Washington, all these other sources of lumber supply are much nearer the big consuming markets of the East, both in distance and point of time, than the mills are here in western Oregon; that is cor- (3819) rect, is it?

A. Yes, sir.

2101 Q. Now does that difference in distance and time as between the western Oregon mills on the one hand, and the southern pine mills, say, on the other, from such markets like Illinois, and Indiana, and Ohio, and the States east, become an important factor in your competition with the southern pine mills?

A. Well, I am not familiar with that question. I left the southern pine field ten years ago, when I came from the South. Prior to the war it was not uncommon to take 60 days to move a car of lumber from a point in Arkansas to a point in Illinois, or off of the Kansas City Southern, or the M., K. & T.—any of those southern lines. There was nothing uncommon about it. The average was more than six weeks. But I have an idea that those roads have improved their condition and handle their business more promptly than they used to.

Q. Well, what I was getting at is this: Suppose there was an eastern lumber yard that had some items he could get either in the southern pine or in Douglas fir, and it was just a question of price and time of delivery. Now if he could get a delivered price on the

southern pine items that was comparable with the delivered price on Douglas fir items, do you think that the eastern lumberman ordinarily, before he decided where he would buy, would take into account the time within which he could obtain delivery of the stock that (3820) he wanted?

A. Well, the delivery is so good from the Pacific coast that I don't think that would enter into it. He knows about the time it takes to get lumber from here. Ever since I have lived on this coast the service has been good; the railroad service is good; and I think the service from the transcontinental lines on this coast is better than from any other part of the country. They perform a faster, better service they ever performed from the South or any other lumber district.

2102 Redirect examination:

I do not expect to see, anywhere in the near future, in Oregon and Washington, any great increase in the production of fir lumber above what it has been, and I hope it will not come. (3821.)

GEORGE B. MCLEOD was thereupon produced as a witness on behalf of defendants and, having been duly sworn, testified as follows:

Direct examination:

I am the manager of the Hammond Lumber Company. The Hammond Lumber Company mill is in the Willamette Valley on the Mill City branch of the Southern Pacific, 35 miles east of Albany, and has a capacity of 55,000,000 feet a year. The mill has been operating up there since the late 'eighties, but by our company since May 1, '99. Located exclusively on the Southern Pacific.

We route our eastern shipments by Roseville, to the extent that they can be delivered that way. A Minneapolis car goes the other way. We use that route because that is on the initial line, and we want to give our business to the line on which our mill is located. And we have been doing that all these years with the Portland gateway open to us. (3822.)

As to what other mill in Oregon are our people interested in: The Hammond-Tillamook Lumber Company has a mill at Garibaldi, on Tillamook Bay. The Hammond Lumber Company Mill City mill is on the Mill City branch of the Southern Pacific 35 miles east of Albany. The Garibaldi mill is about 2 miles from the ocean, on the Southern Pacific, on the Tillamook branch of the Southern Pacific, 100 miles from Portland.

2103 I am familiar with this proposed cross-State line that is asked for here. That is going to have no effect upon us in the routing of our business. With the cross-State line an accomplished fact, we will still route Southern Pacific, for the long haul, either by way of Roseville or Alturas. (3823.)

The capacity of the mill down at Garibaldi is 75,000,000 feet a year, one shift. We ship there about one half by water and the other half Southern Pacific. The production now is 75,000,000 feet

a year, the Garibaldi mill; 55,000,000 a year at the Mill City mill. That is 8 hours a day. That is the production. Asking if that is the capacity: That is what we produce. The Mill City mill is not equipped to run nights. The Garibaldi mill is equipped to run nights. We have the logs on hand and can run nights right now if the market justifies it, but unfortunately it does not. That means that we are now shipping about 92,000,000 feet per year by rail. The Hammond Lumber Company had a big mill down at Astoria, Oregon, that burned here two or three years ago. Our company was in the business there 14 years. (3824.) The capacity of that mill was about 200,000,000 feet a year, day and night. That was located on the Spokane, Portland & Seattle Railway and on tidewater. We shipped some by rail. As to who got the long hauls: The Hill lines, the two Northerns.

I have lived in this State 28 years, barring 4 years I lived in California.

As to my judgment with respect to this cross-State line, I think it will be hurtful to the western Oregon lumbermen, because it will take business away from a line that can carry it all, and then we will have a capitalization built up that we will have to pay a rate to justify it, or to carry it.

2104 Cross-examination:

Q. (By Mr. ELLIS.) Would you still say that, Mr. McLeod, if it were shown that the cross-State line would be a more economical route for the transportation of the lumber, and that the earnings of the carriers might be increased through its construction? (3825.)

A. I can't answer that "yes" or "no." The Southern Pacific can carry the business. If you built another road, it takes business away from a carrier that can take care of it, and, therefore, there is a railroad that is equipped to do business and can't do it because the traffic is diverted from it. The same thing from even the Portland gateway.

Q. Well, to what extent do you take into account the saving in length of haul of more than four hundred miles via the cross-State line as compared with the existing route through Roseville?

A. Well, the railroads are built and they have got to be maintained. We that furnish the freight have got to be charged a tariff to maintain the roads.

Q. Well, don't you think you are paying now for that 400-mile haul, that extra 400-mile haul?

A. No, no; I think the railroad is making less, but I don't think that that changes the rate at all. The rate will be just the same, because we have got four or five roads serving here, and that won't upset the freight traffic by building that cross-State line.

Q. You think the railroads themselves are absorbing that cost of 400-mile haul?

A. Yes.

Q. Well, if by means of the construction of the cross-State line and an adjustment of the divisions between the carriers,
2105 (3826) the Southern Pacific Company could make as much earning as it does not on its western Oregon lumber and escape the burden of this 400-mile haul that you say it is absorbing, you wouldn't have any objection to routing your lumber across the cross-State line, would you?

A. If the Union Pacific would want to give them enough to take care of their local and all they would lose on their overhead on their present main line, that would be one thing, but on principle—it comes back to principle—we want to favor the line on which our mills are located.

Q. You understand the proposal of the Oregon commission is that the Southern Pacific should be given as much earning on the western Oregon lumber as it is getting now via the longer route. Now, do you see any—would you have any fundamental objection to that sort of a plan?

A. Well, on an even break I would give it to the Southern Pacific. If the Southern Pacific were going to get more by losing the traffic, and would say so, as long as we are on their lines I would favor them.

Q. In other words, if they are going to get more by hauling it this additional 400 miles——

A. No; if they get more out of it net, taking into consideration the loss of traffic which couldn't carry the overhead on the longer haul under the factors, if the Southern Pacific (3827) would make money by giving away the traffic—which I don't think they could—I would favor turning the business away from them.

Q. Have you even been solicited by the Union Pacific system officials for the routing of your lumber traffic, eastbound
2106 through the Portland Gateway?

A. Yes; Mr. Engelke, from Mr. Lounsbury's office, calls on us regularly for us to route our freight by their route, but we give it to them at Ogden instead of Portland.

Q. Did he ever ask you to give it to him through Portland?

A. Oh, yes; he wanted just a few cars, but we didn't give him the few cars.

Exam. ROGERS. What did you tell him?

A. I told him, "We are on the Southern Pacific, and we are on branch lines, and we are doing all our business with them; we have got to maintain the road we are on and see that they are profitable in getting the business."

2107 Redirect examination:

I am a member of this Willamette Valley Lumbermen's Association. All of the men in that association do not favor this cross-State line. (3828.)

Further cross-examination:

The Hammond Lumber Company does not favor this cross-State line.

The Mill City mill shipped by rail last year about 2,000 cars. This is my best judgment. From the Garibaldi mill—our company acquired that April 1, 1927, and it ran in a desultory manner up to the middle of April this year, because we didn't have a log supply. But since then we are shipping at the rate of, say, 1,400 cars per annum by rail. Of our 2,000 cars from Mill City, about 45 per cent of those move east of Ogden or Granger. We even ship to Massachusetts, high-grade lumber, kiln-dried, worked right ready to go into houses. (3829.) I don't know how long it takes to go from Mill City to Massachusetts by rail, but we don't have complaint in regard to it. I think it takes less than 14 days to go to Chicago.

We get orders from customers for immediate shipment. Those orders come in not infrequently. We get orders from our customers requesting or specifying routing via various lines, and I would qualify that, mainly the delivery line. If we got an order, however, from a valued customer in the East asking us to route his shipments over the Union Pacific system lines, very likely we would observe such a request.

I said that the cross-State line, if built, would, in my opinion, be hurtful to western Oregon lumbermen. I have heard of the Alturas line of the Southern Pacific. I know that it has been announced in the papers that that line is being built now and will be put in operation about the middle of next year. (3830.)

2108 I do not think the construction and operation of the Alturas line will be hurtful to the interests of the western Oregon lumbermen.

Q. Why not?

A. Well, if—now, part of this is what I have read about the country it goes through, and part of it I know at first hand——

Q. Before you answer this question, I want to tell you, Mr. McLeod, it has been testified in this hearing by the chief engineer of the Southern Pacific that that line will represent an investment of approximately $6,000,000, so I wish you would keep that in mind, in answering.

A. Well, the Southern Pacific is building it—that has a bearing—but it will go through a country out of Klamath where there is some agriculture, and further on it goes through pine timber, and will develop something new.

I think the building and operation of the Alturas line will be of benefit to western Oregon lumbermen, in this way: We will go east then on a shorter road with one company (3831) handling us throughout, handling our freight through to Ogden. One company handles our freight through to Ogden now.

Q. All right, then we can leave that out. Then by using the Alturas route western Oregon will have a route little more than 200 miles shorter than the existing route through Roseville. Now, is there any other benefit, or possible benefit, you have in mind to

western Oregon lumbermen that will result from the building and operation of the Alturas line, than that shorter route by 200–212 miles?

A. I don't know of any other.

Q. Now, the cross-State line route from western Oregon, Eugene, and points in Lane and Douglas and the central western Oregon counties, will be an additional 215 or 220 miles shorter to the East, even, than the Alturas route. Now suppose that in this pro-
2109 ceeding the Southern Pacific were required to build this cross-State line over to Crane, or to join in the building of it, so that it had the right and would use the line as its own line clear through to Crane, would that change your opinion at all as to the benefit to come from construction of the cross-State line to western Oregon lumbermen?

A. I believe to that extent it would. (3832.)

Further redirect examination:

I mean by that that they have the line on which our mills were located, have sized up this situation and realized that it was a profitable thing, and then we would favor the line on which our mills are located, and it would have traffic to sustain it. By which I mean that if the Southern Pacific Company has the Roseville route and the Alturas route, and also the cross-State line route, we will give them the cars and let them take any way they want to.

Q. Now, do you, Mr. McLeod, look to see any substantial increase in the production of fir lumber on the west coast here? I ask you that question because traffic estimates brought in here in this case show a very—rather a large prospective increase that is expected to move, and that this cross-State line will be necessary to help move. Now, what have you to say along that line?

A. I regret to say that with my experience that idea is fallacious. (3833.)

Exam. ROGERS. Where is the Alturas route going to benefit western Oregon shippers?

A. I feel that because it will get traffic and it will benefit the road on which our mills are located.

As to whether I mean by that that the benefit will come to western Oregon shippers in the same way and to the same extent as if the Southern Pacific had an increase in the passenger business:
2110 My thought is this, that that road being built by the (3834) Southern Pacific, therefore it speaks for itself if they build if they think they are saving in the traffic east, and, therefore, we will benefit by having the road on which we are located interested and giving us some better service. We are getting good service, but if we can get better service, why, we are not averse to taking it.

Exam. ROGERS. Well, do you think you can get better service by reason of this shorter distance over the Alturas route—is that what you are talking about?—or is it just the general benefit to the Southern Pacific that will come about through the Alturas route?

A. I think both. I think we will get some better service.

As to supposing that they didn't build the Alturas line but did build the cross-State line whether that would change our routing any: I would favor giving the business then to the Southern Pacific, and presumably if they built that road they built it to use, and therefore would take the freight that way.

Exam. ROGERS. Well, suppose they built it, though, because the commission told them to—suppose instead of routing this eastern traffic over the cross-State line, and they continued to take it through Roseville as now, would you change the routing (3835) on your freight?

A. Well, I would be inclined to work the railroad on that. If they could handle it cheaper one way and wanted it. I would be inclined to see which way we could cooperate best with the carrier.

As to whether that would amount to this, that if the Southern Pacific built the cross-State line we would still leave the routing to the Southern Pacific, and if they wanted to take it through Alturas or Roseville, we would leave it to them: I would be inclined
2111 to do that, to let them route it by any of the three alternatives, if they had them all.

The sum of this testimony concerning the routing of traffic is that we give it to the road that serves our mill.

Forty per cent of our lumber is sold from our Chicago—we have a lumber yard in Chicago and do a very large business there, and forty per cent of it is sold and distributed out of that depot. (3836.)

Comr. MCMANAMY. Now, suppose that the cross-State line is built by the Union Pacific, and your lumber was routed that way. In both cases you have a through line to Omaha. Are you losing anything or gaining anything either way?

A. Well, you are supposing something that wouldn't be, because we wouldn't route it that way. We would send it through Ogden via the Southern Pacific.

There would be an advantage in it, as far as the one-line haul is concerned. It is true that the same number of lines handle our freight.

As to whether on my theory it would be better if we just had one railroad system throughout the country: Well, I think that would be a fine thing, and then we wouldn't have the financial crimes that have been perpetrated upon us, like duplication of freight all over this northwest here, the Milwaukee Railroad building a road that broke itself and broke the two Northerns. That's what I don't want to see here, misdirected effort, that's my idea. (3837.)

2112 C. E. DAY thereupon resumed the witness stand, and testified further as follows:

Direct examination—Contd.

Q. (Mr. DEY.) Now, Mr. Day, you were in the course of an analysis of Mr. Newell's Exhibit No. 16. Will you proceed at the point where you left off, which I think at that time you were dealing

with Mr. Newell's use of averages on specific traffic that doesn't conform to average.

A. Before I take up that matter I would like to explain more fully the matter of direct cost percentages that I have obtained, and the method that I use a great deal to describe in this manner. I take an average month's traffic and I find that costs a certain amount of money, then I take another month that is, say, 40 per cent higher than the average, and, as an example, it may cost 22 per cent more money. Then dividing the 40 per cent into the 22 per cent gives me 55 per cent as the cost of the added business. Then I make comparison with a month that is lower than the average, say 20 per cent lower, and I find that the cost in that month is only 10 per cent lower than the average month, so I divide that 10 by the 20, and that gives me 50 per cent as the cost (3838) that we have saved by that business dropping to the 20 per cent. I get a different result for each month—that is, I have 12 different results in a year—and then I use the mathematical rule for getting the most probable value of that percentage, and those are the percentages which I have given in this analysis. That is, if the expenses had exactly fluctuated, month after month, this formula would give you the exact percentage as a measure of the cost of the business that is added, or the amount that we would save if it were subtracted from our traffic.

2113 I now refer to Mr. Newell's use of averages to specific traffic that does not conform to average. Mr. Newell has based all his calculations on a train consisting of 56 cars. I used the month of October, 1927, and found that the average length of trains, not counting caboose, between Eugene and Ogden to have been—eastbound, 67 cars; westbound, 62 cars.

The corresponding efficiency of loading represented by these cars was found to range within the following limits on the various districts:

Eastbound, 55 per cent to 97 per cent;

Westbound, 52 per cent to 75 per cent.

If Mr. Newell had used these numbers of cars per train he would have obtained a lower direct cost in his calculations.

The error of Mr. Newell's application of average empty haul cost to the specific hauls under consideration, has been (3839) fully covered in the testimony of Mr. Burckhalter and shows that Mr. Newell has overestimated the direct cost in this particular.

In conclusion: It is to be observed that all the defects in Mr. Newell's estimate, which have been observed, point to the fact that Mr. Newell's cost data are too high.

By having his cost level too high, considering the Southern Pacific aspect alone, he underestimates the net revenue earned from the Oregon business which it is proposed to divert to another carrier, and, therefore, if the Southern Pacific Company is to be recompensed for the net revenue which it will lose on account of the proposed

diversion of traffic it will have to receive a greater division of the through rate than that proposed by Mr. Newell.

Based on the hurried study, it is my judgment that Mr. Newell's direct cost should be reduced at least one-third due to
2114 his cost data alone. Also his direct cost should be reduced further by the amount representing the erroneous cost of empty car movement.

Mr. Examiner, you requested yesterday what this would produce in the final result, and this is part of the testimony, leads up to that.

To carry out Mr. Newell's plan the Southern Pacific Company would have to receive a much greater division of the through rate as represented by these corrections. Now, if the (3840) Southern Pacific Company participates in the gross revenue to a greater extent than that figured by Mr. Newell, it naturally follows that the Union Pacific will receive a lesser net return, upon which it must depend for its justification in building the cross-State line.

In Tables XXI and XIX Mr. Newell has shown the Union Pacific aspect on a rate division that contemplates making the Southern Pacific whole approximately for the loss in net revenue which it suffers on account of the diverted traffic, and at the same time it leaves all the benefits to the Union Pacific to support the Union Pacific's investment in the new construction.

In order to show what effect these changes would have on Mr. Newell's final conclusion, I have prepared an exhibit. (3841.)

(Said statement was thereupon received in evidence, marked "Defendants' Exhibit 108, Witness Day.")

This exhibit is entitled "Southern Pacific Company's—Pacific lines—correction of Mr. Newell's Exhibit 16, etc."

In this exhibit I have shown the results for the first year and the fifth year. I start by taking Mr. Newell's net return for diverted traffic and deduct from it the amount representing the empty haul included, and that leaves a net without the empty haul feature. I then take off one-third, which represents the correction on
2115 account of his cost data, and that leaves a corrected figure for the diverted traffic. I then take his direct cost for newly created traffic and deduct one-third on account of the cost data, leaving a corrected direct cost; subtracting that from his gross earnings produces the increased net earnings on account of traffic created. I then recap these two savings and add to it the net passenger revenues shown on his page 141. The total of these three items is then reduced by the amount representing the indirect expense and taxes on the cross-State line, leaving the total return. (3842.)

It will be observed from the exhibit that the corrected results show that the Union Pacific will earn a return in the first year amounting to $126,313.00, and in the fifth year $382,267.00. The return in the first year based on the new investment of $9,908,000.00

represents an annual return of 1.3 per cent in the first year and 3.9 per cent in the fifth year.

Mr. Newell's conclusions show a net return for the first year of 4½ per cent and the fifth year 8.4 per cent.

Q. (By Mr. DEY.) Now, are you prepared to say that the reduction you have made in his cost data is all the reduction that should be made, or that a careful analysis of his statement would require more to be made?

A. That is true; I have only made corrections or studies of certain features of it, and from that I conclude that his cost at least should be reduced one-third, and fuller studies might develop even more than that.

It is not possible that this fuller study might disclose discrepancies the other way that would balance out the changes that I suggest. I didn't seek discrepancies that would be in our favor. I just studied the ones that seemed to lend themselves most readily to examination, and they all point that same way.

2116 Exam. ROGERS. You have on the bottom here "Return on (3843) $9,908,000.00." I take it that that is on traffic that Mr. Newell based his calculations on?

A. I am just correcting——

Exam. ROGERS. Accepting his traffic data?

A. Well, I am just applying the corrections to his calculations. It is true that I am accepting his estimate as to what this line will cost, $9,908,000.00. It is true if every other testimony shows it will cost $11,000,000.00 to build it, that will produce the percentage of earning. I have accepted all of the traffic that Mr. Newell took into consideration in arriving at his earnings, and I have only made a correction for the empty car haul as Mr. Examiner intended, that is, that the Southern Pacific furnishes all the empties to them, as they are now doing, and the subtraction that I made is only the subtraction with the figures in the haul over the two routes.

I have not allowed the Southern Pacific any compensation for handling empties for some other carrier.

Exam. ROGERS. I take it that we should have said you used (3844) the traffic figures, rather than accepted them.

A. Yes.

As to whether I can tell from my consideration what portion of the operating expenses for maintenance of way and structures vary with the traffic, or vary with use: I have made studies of my own, using the formula that I have quoted of the A. R. E. A. It is also known as the Yeager formula. I believe that that is as good a measure of it as can be found.

Exam. ROGERS. What is that? What does that amount to?

A. Well, it includes the full schedule of percentages to be applied to the different items. That is, superintendence would be one per cent, and track-laying and surfacing another, and on each item of maintenance of way. When applied to all the railroads of the

2117 United States it worked out 33 per cent. The percentage

works out differently depending upon the amount of business that is being handled on the road.

As to what was the maintenance of equipment expense: That formula doesn't cover maintenance of equipment. Mr. (3845) Newell has assumed 100 per cent. I haven't analyzed it to see what it would be, but it is my judgment that it would be considerably less than 100 per cent.

Exam. ROGERS. Well, have you at any time considered the case decided by the commission in volume 70 of the commission's reports, in regard to settlement under section 209 of the transportation act? There I think they used 80 per cent for maintenance of equipment.

A. Yes; that is the percentage they used. I have used that, but I have never verified it.

They used one-third there for the maintenance of way and structures, that is the average that Yeager got when he applied this to all the railroads of the United States.

There is another point that I haven't brought out here, and that is that as business increases we get a greater use of what locomotives, for example, that we have. That is, I can take a lean month and find that we will handle a certain number (3846) of tons per locomotive, then I can take a busy month and I find that we handled more tons per locomotive, and added business doesn't add even locomotives at the full measure.

Exam. ROGERS. Now, as I understand Exhibit 108, if we want to get the total corrections, according to the Southern Pacific's views, in Mr. Newell's exhibits, we consider this exhibit together with Mr. Burckhalter's testimony about the cars, about the empties?

A. In addition to this, Mr. Burckhalter covered the cost the Union Pacific would suffer on account of having to get the cars back to this interchange, and that is in addition to this.

2118 If we use that, that would run into a million dollars or so.

Mr. DEY. That hasn't been used?

A. This is just what you asked for.

Exam. ROGERS. I know.

Mr. DEY. It is only the saving that Mr. Newell erroneously figured on the empty car haul on cars that are not hauled empty by the Union Pacific.

Exam. ROGERS. What is it?

Mr. DEY. This one deduction up here of $180,000. That is the only figure of Mr. Burckhalter's that this witness has used, the only deduction (3847) he has made on account of Mr. Burckhalter's testimony. And that was a saving that Mr. Newell erroneously figured on cars that never moved that way, that couldn't move that way unless hauled out from Omaha at an expense of a million and a half dollars or so.

Cross-examination:

As to whether my Exhibit 108 was compiled on the basis of Mr. Newell's original exhibit, or whether I took into account his Exhibit 107 introduced in this case today, it is based on the Exhibit

16. And there will be some substantial correction to be made to my exhibit to make it correspond with Mr. Newell's Exhibit 107. To the extent that Mr. Newell has included additional revenues in Exhibit 107 that were not included in Exhibit 16, my exhibit doesn't show the correct return on—assuming my corrections to be justified.

Exam. ROGERS. Why not?

Mr. ELLIS. There is additional revenue that has been added by Mr. Newell since this computation was made.

Mr. DEY. They came into this case with one traffic set-up
2119 (3848) incorporated in Mr. Newell's book. Now today a new traffic set-up came in here involving Idaho and Alkali Lake, and one thing and another, and, of course, Mr. Day has not considered that later set-up; he hasn't had an opportunity.

Mr. ELLIS. I am not criticizing Mr. Day. I just wanted to develop the fact that that wasn't included.

Exam. ROGERS. Well, can you, Mr. Day, give consideration to that exhibit, or will that be out of the question?

A. That would be a little bit difficult. My conclusions are drawn rather by the use of Mr. Newell's cost data of Southern Pacific figures, and I don't believe that I could make that.

Comr. MCMANAMY. I am wondering if the traffic set-up, so-called, introduced by Mr. Newell today affected these figures?

A. What set-up?

Comr. MCMANAMY. Mr. Day referred to the new traffic set-up that Mr. Newell introduced today. In what way will it affect these figures?

A. If they developed that traffic and would profit from it that would show a greater return.

Comr. MCMANAMY. This only refers to diverted traffic, doesn't it?

A. No; that refers to all the traffic that Mr. Newell contemplated in his Exhibit 16. It was diverted traffic, as well as that originated on the line.

Exam. ROGERS. The only change would be in the created (3849) traffic, wouldn't it?

A. No; there is a change in the diverted traffic.

2120 Mr. DEY. Well, he doesn't——

A. I mean the cost due to the diverted traffic is changed.

Exam. ROGERS. Yes; if I understood Mr. Newell's exhibit here introduced to-day, he simply increased what he called created traffic.

A. In Idaho?

Exam. ROGERS. Yes.

A. Yes; but he has some created traffic on this line that he has figured in this set-up.

Mr. DEY. You have taken the diverted traffic and the created traffic that was used by Mr. Newell, and which he took from the Teutsch exhibit, and from the original Wiggins exhibit, and that is the basis of Mr. Day's statement, or exhibit. Now, then, in so far as additional created traffic that has come in here in Exhibit 107,

or 108, or whatever it is, then of course, it requires some modification of this exhibit.

Exam. ROGERS. What I was getting at, the criticisms that Mr. Day has pointed out in Mr. Newell's exhibit are not involved in this Idaho traffic, are they?

A. Only by inference, that you might infer that because the (3850) cost data were too high on the other lines they might be too high in the computation in this second set-up.

Comr. MCMANAMY. This second so-called set-up was simply an analysis of figures that were introduced before, brought in by Mr. Newell, as I understand it now.

Mr. ELLIS. No different set-up. We made our reservation at the time it was introduced, and told the carriers that we wanted to bring it altogether in the final statement.

Mr. DEY. Well, if it isn't a different set-up why was it
2121 necessary for Mr. Newell to come in with any additional figures, unless he is considering additional traffic to what he first considered?

Mr. ELLIS. Because he had to apply cost figures to the Idaho traffic, which he didn't have at first.

Exam. ROGERS. What was the object of your question of the witness as to whether his figures were based on Mr. Newell's Exhibit 107?

Mr. ELLIS. Simply to develop that the earnings on the investment which he has shown would be increased by adding the Idaho traffic, which was not in Mr. Newell's original set-up.

Exam. ROGERS. Under the heading of "Created Traffic" on Exhibit 108?

Mr. ELLIS. Yes; that is all.

Mr. DEY. It would run the net from 8 per cent to 17, by bringing in additional traffic. (3851.)

Q. (By Mr. ELLIS.) Now, Mr. Day, I believe you replied to the examiner's question that there would be no compensating discrepancies to contrast with those which you believe to exist and have pointed out. What would be the result of your cost figures—or Mr. Newell's figures being too high on the revenues from created traffic moving from points on the line and moving from Idaho across the line?

A. Well, that is just as I showed you on this exhibit—it shows a larger net revenue on the created business. That is, that is shown on Exhibit 108. So it does have that compensating effect on the net but not on the cost.

Q. Then you think the net result is this, that if they are too high, if his cost figures are too high, it will reduce his claim of earnings on the traffic originated in western Oregon, but it will reduce
2122 the earnings on the short haul traffic from Idaho and from points along the line?

A. If I understand your question, I don't think that is true.

Q. Now, with reference to the fuel costs, which you say are erroneous, it is a fact, is it not, that Exhibit 16 takes into account the entire fuel costs of the Oregon-Washington Railroad and Navigation Company, as you understand it?

A. I believe that is explained by Mr. Newell, but I, of course, don't know. (3852.)

Q. Well, now, I believe it is your testimony that in applying those fuel costs to the particular case that you called attention to, or the particular hauls, you have found them to be too high?

A. That is true.

Q. If that is true, and Mr. Newell has used the average, or used the cost for the entire system of the Oregon-Washington Railroad & Navigation Company, must it not follow that those same cost figures for Newell would be too low is applied in other places or on other hauls?

A. No; it doesn't follow.

Q. Well, if he has used the total, which would be an average figure, would result in an average figure, and you say they are too high in those certain places that you have described, must they not necessarily be too low in other places?

A. If he had changed his data by consideration of the fuel that was used between Ogden and Eugene and got an average cost in that manner, then when he multiplied it back what you say is true, but he got his data on another line and he applied it to the Southern Pacific, and being too high it would be too large a result on the Southern Pacific hauls.

2123 Q. Well, would you be in a position to state, if they are too low in other places, just where they would be too low, or on what sections of the haul the fuel costs of Mr. Newell would be too low? (3853.)

A. Well, I don't think they are too low on any of the hauls on the Southern Pacific.

Q. You think that on any haul that you could pick on the Southern Pacific Mr. Newell's fuel costs would be too high?

A. Well, where the fuel consumption is important. I picked out the two points where it is the most important; that is, we burn the most fuel on that climb between Eugene and Crescent Lake, and the other next most important point is between Roseville and Sparks, and because they have greater importance I made the tests at those points. On the level grades or on the down grades where it has no great weight I didn't consider it.

Q. Now, in the recent grain rate case, Mr. Day, did you not introduce a number of exhibits tending to show the high cost of fuel on the Southern Pacific lines, and to show that Mr. Newell's cost figures were entirely too low to apply to Southern Pacific operations?

A. His cost data were too low?

Q. Yes.

A. Not his direct costs. I never thought his direct costs were too low.

Q. Well, didn't you take the position, and so testify in that case, that his cost figures as a whole were too low to be applied to Southern Pacific operations?

A. I didn't take that stand; no. I offered testimony to show that the costs in Oregon were higher than the costs of the (3854)
2124 system as a whole, largely on account of local service and branch line service, and the question here involved is the hauling on the main line in through trains, largely, and it is a different matter.

Q. Well, didn't you introduce exhibits to show the high relative costs of operating the Southern Pacific lines, to show high fuel consumption?

A. I made comparisons between Oregon and the system as a whole, and I found that they, compared to the system, are higher in Oregon.

Q. Well, is it not true that the fuel costs of your company compared with those of the Oregon-Washington Railroad & Navigation Company are very much higher?

A. Mr. Newell shows that in his exhibit, but I don't know where he got the figures. (3855.)

Exam. ROGERS. What case are you talking about?

A. He is talking about the——

Exam. ROGERS. The grain case?

A. The grain case.

Mr. ELLIS. Well, Mr. Newell has used the same figures in this case, the same cost figures.

A. I don't know whether Mr. Newell used the averages, including all branch-line operations, or whether he used just main-line operations. We are speaking now of the main-line operations.

Q. Well, did you ever made a check of the fuel costs on the Oregon-Washington Railroad & Navigation Company to see how they compared with your fuel costs?

A. Well, I have seen comparisons, but I don't——

2125 Q. Well, do you question Mr. Newell's statement in his report to the effect that train fuel per thousand gross ton-miles on the Oregon-Washington Railroad & Navigation Company system in Oregon is 53.9 cents, as against 73.2 cents on the Southern Pacific lines in Oregon?

A. I don't question Mr. Newell. I don't know how he got those results. I say possibly the high results he got on the Southern Pacific, because he considered fuel and branch line operations, which are always more expensive than through line operations.

Exam. ROGERS. As I get it, you take all the lines in Oregon (3856), you get one figure, where if you take this haul to destination you get another one?

A. Exactly. If you take the main line operations you get one value for your fuel oil, if you take branch lines you get another

value, if you take combined main and branch you get an intermediate value.

Q. (By Mr. ELLIS.) Did you not take the position in the grain rate case that Mr. Newell's train-mile costs when applied to a heavy car of wheat should be calculated on the basis of the tonnage, and that the same amount should not be allowed for each car regardless of the weight, whether light or heavy?

A. I was talking about the train cost element, and the trains are made up on the basis of the tons and not cars, and it was my position then that Mr. Newell should have used as a measure of the train costs tons rather than cars. That is, he figured a 56-car train of empties, and a 56-car train of wheat at—I think 52 tons, was it?—or something like that—and that resulted in a train load that exceeded the ratings of the locomotives used on the district. (3857.)

2126 PORTLAND, OREGON, *August 24, 1928.*

C. E. DAY thereupon resumed the witness stand, and testified further as follows:

Cross-examination—continued.

I have not made any attempt to apply the correction of my Exhibit 108 to the additional figures submitted in Mr. Newell's 107.

Q. Well, would you be willing to agree with me that the percentage of return the first year would be increased from 1.3 to approximately 3.2 per cent return if those figures were so applied to Mr. Newell's Exhibit 107 figures? Does that seem to be about correct?

Mr. DEY. Well, Mr. Commissioner, I object to that question, because it is obvious that the witness has had no opportunity to make any figures in that regard and how can he possibly agree with counsel that a certain percentage or a fraction thereof to be applied would be correct?

Comr. MCMANAMY. Can't you change your question, Mr. Ellis, to find out if the witness has made figures?

Mr. ELLIS. Well, I asked him if he had calculated it himself. Have you sufficient information so that you could approve the figure or dispute it in any way? (3858.)

A. Well, I don't know what figure you refer to when you—that is, you mean could I apply a correction to Mr. Newell's figure pertaining to this added traffic that you figure in this Exhibit 107?

Q. Yes; you agreed with me yesterday that the additional figures submitted in Mr. Newell's Exhibit 107 would change
2127 your percentage of returns from, and I was wondering if you would agree with me that it would change it substantially—in fact, about double the percentage of return which you have shown on Exhibit 108?

A. Well, it would depend on how much traffic you were originating with that different cost. Of course, not having made a test, I don't know whether it would double it or make it any other percentage of correction. If Mr. Newell's cost data is too high on the Southern

Pacific, it might be too high on the Oregon-Washington Railroad & Navigation Company or Oregon Short Line, but I have only tested it in relation to Southern Pacific costs.

It is true that if they were too high on the Oregon-Washington Railroad & Navigation Company I would of course make the same correction of one-third reduction on the Oregon-Washington haul that I made on the Southern Pacific.

Mr. DEY. I don't know—let me get that clear—I don't (3859) know as I understand that question aright. If they were too high on the Oregon-Washington Railroad & Navigation Company you would make one-third reduction?

A. No; it would take a correction.

Mr. DEY. Well, he said one-third reduction.

Mr. ELLIS. The correction would depend, you think, on the exact operating conditions that were found to exist on the particular section of line?

A. It would depend, in the first place, on the volume of traffic that was contained in that computation, and it would also depend upon how much the figures are to be—the cost data are to be revised downward.

Q. Will you explain a little more clearly how you arrived at the figure of one-third which you have applied?

2128 A. That one-third is a judgment that I formed after studying particular data, that is, the one that I have enumerated. I find that he is too high in those, and that sizes up about one-third to—justifying a reduction of one-third.

Q. You checked certain individual items, and because you found they were, in your opinion, too high, you assumed that all other items were too high and made the correction accordingly?

A. I made specific deductions as to certain other items. There are other items that I didn't check that I know would result (3860) downward as well, but I don't know just how much they would be revised downward.

Q. Well, in making your check, Mr. Day, didn't you pick out the item which you expected you would find to be the highest or the most out of line with your ideas?

A. No; I didn't. I picked out fuel because Mr. Newell's computation has it all in the one item of foot-tons, and it was a comparatively easy matter to work back and find out what the fuel amounted to in his foot-ton calculations, and, also, fuel consumption is a very definite thing in actual performance, and I could get something—a real, true comparison; that's the reason I chose that. I would like to have compared his labor cost, but his labor is broken up into different parts, and to work the labor item out of his cost unit isn't so simple, and I hadn't the time to make that comparison as respects his labor costs, which would be also too high.

Q. What percentage of the total number of accounts did you actually check out in detail?

A. Well, they are all in the testimony, just what they are, and the percentage can be worked. I didn't figure the percentage out.
2129 I should say it is not a very minor percentage of the total. Fuel is one of the big items. The train service expense is a big item. Of course, that includes the fuel. (3861.) As to whether I checked more than ten or fifteen per cent of the total number of accounts entering into Mr. Newell's study, I tested superintendence, and dispatching, station expense, fuel, enginemen, trainmen, locomotive repairs—no; I believe considerably more than fifteen per cent I have tested. I think I tested about 75 per cent of the number of accounts—no, 75 per cent of the dollars and cents, that is, 75 per cent of the money involved. That would be less than 75 per cent of the number of accounts.

We have some accounts that are of minor importance. (3862.) As to whether many of the accounts that I discussed in my testimony were of rather minor importance in the total amount involved, well, superintendence is a minor account, but he was nine times too high and I thought it was well to bring that out.

I wouldn't expect year after year to find the same result that I did find with respect to these accounts, not exactly. As to whether I did expect some fluctuation to exist, over a period of years, as business increases our costs get lower upon a unit basis.

Q. And if you took a large number of carriers and made a comparison or study over a period of years, would you not get a result much closer to the one which Mr. Newell obtained through his study?

A. I think it is an—if you refer to the method that Mr. Newell used in getting his direct expense by using data from various railroads, I think that is an inaccurate way, because there are so many other elements that affect cost besides traffic that the result
2130 that he gets by his method is purely accidental and is not a measure of the density factor.

Q. Referring to your exhibit, now, your second item, "Deduct for empty car haul," did you figure that yourself, or is that the figure that you took from Mr. Burckhalter's testimony?

A. That is the figure I took from Mr. Burckhalter's testimony, and it covers just the empty car—that is the sixty per cent item of empty cars that Mr. Newell figured that would move over (3863) that line.

Q. Well, does that figure contemplate that there will be no empty cars hauled over the cross-State line from Ogden?

A. Yes; that figure contemplates none of these cars came from Ogden over the Alturas line, and——

Q. Well, if, as a matter of fact, the record shows that there are seven thousand empty cars delivered to the Southern Pacific at Ogden which could most economically be used in handling Oregon traffic, would you change that figure in any respect?

A. Well, Mr. Burckhalter prepared that figure after a study of the interchange at Ogden, and his decision was that none of those cars found its way up into Oregon. It is true that some cars move westbound through the interchange, but those cars can be used at any

point between Ogden and Portland. In fact, a lot of those cars are used up on the Westwood branch.

Mr. DEY. Pardon me just a moment. If the commissioner please, Mr. Huggins, who testified yesterday, has just come in and states that he made a statement yesterday with respect to his shipments that was not correct, and he wanted the opportunity to change it. He states that he testified that his carload shipments amounted to 1,500 for the year 1927, and he desires to have the record show that it was 2,500. It isn't a matter that is material one way or the other, but apparently he is (3864) conscientious about his testimony and wanted to have that appear.

Comr. MCMANAMY. That may appear in the record. (3865.)

2131 Q. (By Mr. ELLIS.) If there is already a heavy surplus of empty cars in California, you would not expect to haul the cars from Ogden down to Los Angeles or San Francisco and then replace them in Oregon by cars delivered through the El Paso gateway, would you?

A. Well, I didn't offer any testimony in regard to the empty car naul. I thought Mr. Burckhalter covered all of those points. But——

I have adopted Mr. Burckhalter's figures. I also vouch for them, having participated in the calculation. I did not help Mr. Burckhalter arrive at the results he has shown in his Exhibit 103. (3866.)

Q. Well, the empties delivered at Ogden are about half as many empties as Mr. Newell had figured would move over the cross-State line, and if those cars were hauled over the cross-State line, instead of as you claim they would be hauled, that figure of $180,000 would be cut about in two, wouldn't it?

A. Well, I would admit that half of them, or any one of them, came from Ogden up to points in Oregon. Those cars are interchanged for different reasons, and the return of empties, or the forwarding of empties through Ogden may not get as far as California. There is no record to show how far those cars moved west.

I really don't know where those cars go. Nobody knows where all of those cars go. We know that there is a demand for such cars in large volume at Fernley for use on the Fernley branch. As to whether anyone knows where the cars made empty in southern California go for reloading, they know the general flow of empties, that they do move north over the Tehachapi, in large volume,

2132 finding their way up this way. But individual cars move so many different ways that complete knowledge of it could only be obtained after very intensive study. They go to the nearest point where a load is available (3867); that is the practice. And the same rule would hold good on these empties available at Ogden; they would go to the nearest point where load was available for return haul. After they pass Ogden they would be diverted at the point where they were first required. They would not be expected to go to some point in western Oregon for such a point could not be the nearest point because that is the most remote. Whether it would be

the most remote with the cross-State line constructed, that is a different matter. Mr. Newell figured that we could save on the haul of the empties from Ogden up to Crescent Lake. I don't know that that changes the picture. As to whether I am assuming that the line is not there, so the cars could not move, Mr. Burckhalter has covered that in his figure, which turned the profit into a red figure. That is, if they move from Crescent they would probably come from Omaha and the Union Pacific would have the entire cost to support.

Q. Now taking your next item, Item No. 3, after deducting the empty car haul, which we have just discussed, from Mr. Newell's net earning, you arrive at a cost figure. I am wondering (3868) how you can make a deduction such as you have from a figure of net earning and arrive at a figure of cost.

A. The process there was that Mr. Newell's rate or cost level was too high, as represented by this one-third, and if all of his data were reduced to a level one-third lower, the subtraction would also be one-third lower and the correction would apply in that way.

2133 Q. Well, the gross earnings are not affected by your figure of cost, are they?

A. Gross earnings is not in that $715,340. That is the saving that Mr. Newell proposes to make on the diverted traffic, and it results from the difference in the costs by the two lines there. Revenue is not in that figure at all.

Q. The first figure that you have started with is an earning figure purely, Mr. Newell's earning from diverted traffic?

Mr. DEY. It really means saving, doesn't it?

A. It is the saving that Mr. Newell has assigned to the Union Pacific by his process of making the Southern Pacific haul and leaving all of the savings go to the Union Pacific, and that is merely the difference in the cost by the two lines.

Q. (By Mr. ELLIS.) Well, that figure is derived from a division of rates as proposed by Mr. Newell?

A. He divided the rate so that the Southern Pacific would be made whole. Now if he finds that the Southern Pacific costs are higher, he would have to change his division and throw a (3869) less amount in to the Union Pacific item, which would work this way.

As to whether that would really affect the one-third, if his cost level is too high, 50 per cent too high, then the difference in cost on the two lines by subtraction would also be 50 per cent too high. As to whether I worked that out to see if the result would be as I say it is, or whether I have merely taken this process because it was the simplest way I could see of suggesting my idea and because it avoided some detailed calculations, I made this calculation:

2134 I start with Mr. Newell's cost via the Alturas line, on page 117. There he is making the calculation for car of fir lumber destined to Omaha, making use of the Alturas line, and he first sets up the gross earnings of the Southern Pacific based on their present division, and he subtracts from it his cost, and that

leaves a net earning which he intends to preserve for the Southern Pacific.

Then further down he computes the Southern Pacific's earnings when it makes use of the Crane line, and in order to preserve that same earning he arrives at his 27 per cent as the proper division to the Union Pacific.

Now I have made these same corrections, Mr. Examiner (3870), that you suggested, and carried it through to see what this percentage would be; that is taking out of Mr. Newell's costs his empt haul element that we say is erroneously employed, and also making this one-third correction. I start with this $253.75 of the Southern Pacific's share on the present basis, and I subtract from Mr. Newell's direct cost of $174.40 the amount represented by the empty haul movement, $44.52. That leaves $129.88, without the empty haul feature.

I have one-third off of that, because of the rate level—rather, the cost data level—and that, subtracted from the revenue that the Southern Pacific now receives, leaves a net earning of $167.18.

Then I start again with his computation via the Crane line. His direct cost is $48.54, less the empty haul, $3.49, and less the one-third for the cost data of that balance leaves $30.03, the cost to the Southern Pacific on the new line. Then I add to that the net revenue that we are now earning on that business, and that brings that we must receive $197.21 in order to preserve our earnings.

Now that $197.21 is 41 per cent of the gross revenue; that
2135 is, we would have to receive a division of 41 per cent instead of 27 per cent to protect our present earnings from that traffic. Now Mr. Newell's figure of seven hundred——

Mr. DEY. To protect your what?

A. Present earnings on the business that we haul. (3871.)

Mr. DEY. Present net?

A. Our present net earnings. Now it is figures that are remaining after this division that Mr. Newell carries forward and it represented in that $715,340. As I understand it, that merely represents the economies that result from the two lines, and he leaves a little bit to the Southern Pacific in his plan but it is a very small amount compared to the gross, and it is within the probable error of his calculations. So I have just interpreted that seven hundred fifteen as practically making the Southern Pacific whole and throwing all the profits into the Union Pacific, and therefore it only represents the economies that there are from the two routings, and gross revenue is cast out—it hasn't any bearing in that figure.

Q. (By Mr. ELLIS.) Are you sure you have finished your calculation and got down to the final result?

A. Which calculation do you refer to?

Q. Is that all there is to the calculation to get the——

A. To which calculation do you refer?

Q. Well, the one that you went through to get the results in Exhibit 108, arriving at your figure of one-third.

A. You mean getting the 41 per cent, is that the final calculation to get the 41? Is that the question?

Q. Well, in arriving at the effect it will have on the Union Pacific's share of the total earnings. (3872.)

A. Why, if I understand Mr. Newell's figures right, that is substantially it. It is not exactly, nor my one-third is not an exact figure; is it an approximation.

2136 Q. Didn't you, in arriving at this deduction of one-third in making the calculation which you have just described, take out the empty car haul and then again take it out as a separate item under your Item 4?

A. That is just what I did not do.

Q. Or under Item 2?

A. That is just what I did not do. I took off the empty haul first, and that is figured in at the same rate as all the other items in seven hundred fifteen, and that left the cost on Mr. Newell's cost basis for the cost without the empty movement. Then I say his cost level is too high and therefore that should be depreciated by one-third.

Q. Wasn't what you really did was to take Mr. Newell's earnings figure, treat it as a cost figure and then deduct this one-third for the corrections, and then convert it back into an earning figure again and present that here as the true earnings which would result?

A. Mr. Newell's figure is an earning figure; it is not a cost figure, it is an earning over and above cost that he assigns to the Union Pacific by his process of dividing the gross earnings so as to throw it into the Union Pacific's revenues.

Q. Are you contending here, Mr. Day, that a reduction in the (3873) cost figure that Mr. Newell used would decrease the net earnings?

A. It would decrease the net earnings on the diverted traffic, yes; that is presuming that his cost data is also too high at the same rate on the Short Line as it is on the Alturas line.

Q. Would it not, in fact, result in increasing the net earnings, considering the total haul?

A. No.

2137 Exam. ROGERS. Are you talking about savings?

Mr. ELLIS. No; I am talking about earnings now. We are not talking about savings; I am talking about earnings.

Mr. MCCULLOCH. Net earnings.

The WITNESS. That is kind of confusing there. The whole calculation is to figure an increase in the net earnings by providing a decreased cost. They are supposed to be the same thing; that is, the increased earning as a result of the decreased cost, and they are the same thing; that is, the money is the same thing in these calculations.

Q. (By Mr. ELLIS.) Well, you say Mr. Newell's cost figures are too high; assuming that they are too high and you reduce them, can that possibly decrease the net earnings on the total haul?

A. It will do exactly that thing. I believe you understand, Mr. Examiner, that if he figures a cost around the Alturas (3874) that is twice too high, then he had figured another cost via the Crane line that is also twice too high, subtracting one from the other he gets a difference that is also twice too high. That is, all the figures are too high, and to subtract the remaining by subtraction is also too high. Do you follow me?

Mr. ELLIS. I can't follow your logic.

The WITNESS. Well, suppose in round numbers that via the Alturas line it cost $120.00 a car to move by that route, and supposing it cost $180.00—rather, $80.00 via the Crane route; you would subtract and you would get $40.00 as the savings on account of these two routes.

Now then, I take one-half of the first cost, say that the Alturas cost $60.00 and the Crane route $40.00, the saving then is $20.00.

Now $20.00 is just one-half of $40.00; that is, you have reduced your earnings by reducing your cost data.

2138 Q. You are now decreasing savings and not net earnings via the cross-State line?

A. Well, that is what all of this testimony is directed at, is the savings or the economies that are going to result by the cross-State line. It is not proposed to reduce the rates, as I understand it, on account of it, and therefore the net earnings and the savings are identical.

Q. What I am getting at is this: If it costs $100 to carry a (3875) car from Crescent across to Crane, that is, if Mr. Newell has figured it cost $100, and you say he is one-third too high and it only cost $66.00 to haul that car, you have got your difference of $33.00 to add onto the net earning derived from that particular haul?

A. To the Union Pacific?

Q. Yes.

A. Yes; but that is not the problem.

Q. You were not giving particular consideration to that phase of it at all?

A. Well, that hasn't any bearing on the problem.

Exam. ROGERS. As I understand it, Mr. Day, you haven't made any computations as to this method applied to the Union Pacific?

A. Well, yes.

Exam. ROGERS. All your computations are made for the Southern Pacific?

A. No. I checked his data on the Southern Pacific, and then I have made a correction on the basis that everything was wrong in that same rate. And this exhibit 108 is the Union Pacific's aspect, because it leaves nothing to the Southern Pacific over and above its present earnings. (3876.)

Q. You have made a correction by reason of the fact that you say the trains between Eugene and Ogden average 62 to 67 cars, instead of 56 cars that Mr. Newell has used, and assumed that all of his cost units are correspondingly incorrect?

2139 A. I believe my testimony shows that I was criticizing Mr. Newell for using averages to specific conditions where they didn't conform to the average, that is, the average train was considerably longer than he used, and if he had used the longer train he would have had his costs greater in that particular—or lesser, rather.

Q. I wish you would refer to page 67 of Mr. Newell's exhibit 16, and point out just which of those items are affected by that error which you say Mr Newell has made, using the average figure 56?

A. That pertains only to the first item on ——

Q. The item of train mile?

A. The item of train mile.

Q. Instead of dividing 96 by 56, as Mr. Newell has, what figure would you divide it by?

A. Well, if I were doing it I would have a different figure for each of the different divisions; that is, where I found they were running 70-car trains, I would use that 70-car, where I found they were running 100-car trains I would use the 100-car. But I know what you are leading up to—if I were going to use an average, and had to use an average—which I don't (3877) think is right—I would divide by that 67, or whatever I used in the testimony.

Q. Well, after you had done just what you say you would do, when you got through and averaged them again you would get right back to the same st .rting point, wouldn't you, give you the same total?

A. Oh, no; because all of them are higher than 56. Its average aspect, as I believe I pointed out, was 38 per cent higher—or his was 38——

Q. Well, can you state how much correction you would apply to that first item on page 67, "Eugene to Crescent Lake, load"—how much you would change that figure of $1.09?

2140 A. Well, that is about 20 per cent too high. I could take it off that way.

Q. In arriving at that 20 per cent figure, how many cars per train are you using?

A. Sixty-seven.

Q. Sixty-seven; is that the average, or is that the greatest number?

A. That is the average eastbound.

Q. And if the figure were 62, which is—is that the average westbound that you testified to?

A. Sixty-two? The one I used was eastbound. If I used the other it would make 10 per cent.

Q. What do you mean by "eastbound." Is that south? (3878.)

A. Starting out of here, south I use as eastbound.

Q. To San Francisco?

A. Yes.

Q. Now, have you not also criticized Mr. Newell's train mile figures by saying that it was too low by reason of the fact that it

should have been calculated on the basis of tons rather than on the basis of number of cars?

A. I don't know whether that would be too low or too high on that basis. My——

Q. Well, wouldn't that have just the opposite effect from what you have criticized here?

A. Well, that would depend upon whether the particular carload that he figured was more than an average carload over the districts. I don't know just how it would work out.

Q. Well, doesn't lumber load more than average?

A. No; I think it is pretty close to the average.

Q. Well, if the car loading was found to be above the average, it would have the effect of counter-balancing this situation which you say results in increasing the cost to some extent?

2141 A. Well, I say, I haven't made a calculation. I don't know whether it would—I haven't criticized that because of the result he got, but I said it seemed more logical to divide his train-mile costs on the basis of tons rather than on the number of cars, because the train was made up in units of tons and not units of cars. Very seldom the siding capacity limits the size (3879) of the train. In other cases it is the tons, and if it is a string of empties we haul more cars than we do if it is a string of loads, so the train element of cost it seemed a lot more logical to me to use the tons as the basis of division for his unit rather than the cars. As I said before, I didn't direct my criticism to the point that it gave too large or too small a result. It is a matter of logic.

Q. As a matter of fact, it did result in causing the cost to be lower than you thought it would be?

A. I don't know that.

Q. Well, you know that it would on carloads of grain, if the trains were made up largely of grain traffic, or heavy loading traffic, don't you? The result could not be otherwise?

A. Well, I think that when Mr. Newell applies a cost figure in this way to the empty haul I think his empty car cost is too high; and, also, it works the other way—if it is a loaded car, it would be too low.

Q. Well, then these refinements that you suggest in Mr. Newell's study wouldn't all result in reducing the cost, but some of them would result in increasing and some in reducing?

A. Well, we are talking about a very small item there. We are talking about $1.09 in a total of $28.25, and I suppose you could find that what you say has——

2142 Q. (By Mr. McCulloch). Mr. Day, leaving out the question of (3880) cost of empty-car haul, because you haven't personally analyzed and checked that, would you say that Mr. Newell's calculations of the direct cost of the loaded movements of lumber from western Oregon to Granger, Wyoming, via Crane and the cross-State line, via the Alturas, via the Roseville route,

and via the Portland gateway would be affected in any way so far as the parity of results were concerned?

A. I assume that I would say that there would be a difference in the comparison. If I understand your question, that is—the comparisons that he makes is the differences, and the differences would be affected that way.

Q. Well, if he uses the same method of ascertaining the cost of loaded movement by these four different routes that I have described from Eugene to Granger, one via Portland, one via Crane, one via Alturas, one via Roseville, will the comparative results—will the comparative showings of the cost of loaded movement via those four routes under the method that he has used be affected by any criticism you have made of his unit costs or of his methods of calculation? What I am getting at is this, to elaborate my question a little bit—on Exhibit 36 Mr. Newell showed the cost of such a movement via Portland to Omaha is $317.00, via Roseville $372.00, via Alturas $323.00, via Crane $290.00. Now, what I wanted to know is whether those comparative results of direct cost, loaded movement via the different routes, would be affected by reason of (3881) the method that Mr. Newell has used in ascertaining those direct costs, in your judgment?

A. Well, it would—I think I see your point—I don't believe Mr. Newell's analysis has given the proper weight to the different factors. That is, he has got the train-mile costs and the car-mile costs and the gross-ton-mile costs and the resistance costs. I don't
2143 think that the method that he used throws the proper proportion of the costs to the haul as they should.

Q. That is not what I had in mind.

A. Well, then another construction I can put on your figures is that if the $317.00 is too high, likewise the $372.00 will be too high, and they will be proportionately too high, but the differences will be also too high, so that when you subtract one from the other he gets a saving that is also too high, and that is a criticism that I have made in this Exhibit 107.

Q. Well, you are getting nearer to what I had in mind in this last remark. If he follows the same method of ascertaining direct cost for loaded movement via these four routes, according to your criticism he will ascertain a direct cost for loaded movement that is too high in every instance?

A. Sure.

Q. All right. But if he follows the same method of ascertaining (3882) the direct costs for loaded movement by those four routes, will the relation between the results he arrives at—would the relation between the results he arrived at be changed if you had followed your own methods of calculating direct cost for the movement between the same points over those four routes? In other words, would you by using your method of calculations arrive at a different relationship of the direct cost by those four routes than Mr. Newell has, even if his individual direct costs are too high in each instance?

A. You mean if I followed Mr. Newell's method——

Q. No; I mean if you followed your own method?

A. And my own cost data?

Q. Yes; for the four routes?

A. Well, that is pretty hard to say offhand, because of the way the grades and curves work into the problems on the different lines. They are more important on one line than they are on another, and if the basis of assigning the element of cost to foot-tons is
2144 higher than the uses I would get more costs on the hill; if it resulted in a lower figure it would throw a lesser proportion of the costs on the hill, and the comparison would be disturbed by my method.

Q. Well, Mr. Day, if you were undertaking to ascertain the direct cost for loaded movement between Eugene and Granger, Wyoming, for example, by these four routes, would you use a different fundamental method of ascertaining those direct (3883) costs for the different routes, or would you use the same fundamental method of ascertaining your direct cost by all four routes, if you were making the calculations?

A. I would use the same fundamental methods, but I would get the particular data that applied to the different points along the line, and instead of taking averages and applying it all the way from Eugene to Ogden I would try to be more specific and find out what the costs were on the different districts that were covered.

Q. Well, are you suggesting here that Mr. Newell hasn't used the same fundamental method in ascertaining his direct cost for loaded movement by those different routes?

A. No; he has used the same fundamental method. He has used the same cost data on the Southern Pacific, with minor modifications, that he has used on the other lines.

Q. Did you observe from a study of his Exhibit 16 that he used different cost units for different districts?

A. I say he used a different figure west of Klamath Falls than he did east of Klamath Falls.

Q. Well, then, hasn't he given consideration to differences in conditions on the different lines?

A. To that extent he has; yes.

Q. Now, was anything in your testimony, then, intended to criticize or suggest that the conclusions Mr. Newell has reached as to direct cost for loaded movement via these (3884) different routes for lumber from Eugene to Granger or Omaha were not reliable, the comparative results——
2145 A. Yes.

Q. The comparative costs?

A. Well, he hasn't used comparative costs. He has used differences. His differences I criticize.

Q. Well, do you criticize the comparative results of direct cost via those routes as unreliable?

A. I say I haven't criticized the comparative results. I criticize the difference in the two results, and it is the money difference that he has made use of. He hasn't made any use of any percentage relation being preserved.

Q. Now, you mentioned a few minutes ago a hill—what hill did you have in mind? The ascent between Eugene and Crescent Lake?

A. Well, that is one of the big hills on the Southern Pacific, and the other one is between Roseville and Sparks.

Q. Yes; now, when you get to Crescent Lake, as between the cross-State line route and the Alturas route, is there any substantial difference, so far as ascents and grades are concerned, whether you go the Alturas route or the cross-State line route, starting from Crescent Lake?

A. I haven't made any study of the costs on the train line, so——

Q. You can't say?

A. I can't say. (3885.)

Exam. ROGERS. Mr. Day, have you made any analysis of total cost of moving this western Oregon traffic to see whether the present rates are compensatory or not?

A. Yes; I have made in times past studies in connection with those, and I haven't found any rates that are not compensatory.

Exam. ROGERS. To what extent are they compensatory? What returns do they yield as a whole?

A. You mean lumber shipments?

2146 Exam. ROGERS. Well, you can take lumber shipments.

A. Well, if it is local to our lines we earn more on it than we do if we ship it to eastern points, and you can hardly say in a blanket way how much of it is compensatory, but I thought you were directing it to if there were any haul on which we didn't make money. I haven't found any specific haul on which we lost money, as Mr. Newell has found by his method.

Exam. ROGERS. Well, did you find that you were really getting a return to-day of five and three-quarters per cent on this western Oregon traffic, taking the traffic as a whole?

A. Well, I haven't investigated that, and, of course, you can't—that is a matter of assigning, then, if you want to say that lumber wants to contribute a certain proportion of the overhead—I am speaking of just the direct out-of-pocket cost, and some of the shipments don't contribute very much (3886) above the out-of-pocket cost.

Exam. ROGERS. Did you make any such calculation as that, Mr. Newell?

Mr. NEWELL. I didn't hear the first question you asked. I am not quite clear what you are getting at.

Exam. ROGERS. Whether he has made any calculations on this purely cost basis that you have used in Exhibit 16 to determine whether the revenues now derived from this western Oregon traffic yield a standard return?

Mr. NEWELL. I didn't make any of that for that express purpose, but my study of detailed operations would convince me that they did not.

Exam. ROGERS. Now, who are you talking about? The Southern Pacific?

Mr. NEWELL. The Southern Pacific, on that round-about haul. I am talking now only of traffic going through Ogden. I have made no study whatever of what they might earn out of traffic into California, which is very light.

2147 Exam. ROGERS. It is just running around in my mind as to whether in making these computations reflected by Exhibit 16 and what we are talking about here we don't start with the presumption that everything is all right as it is now, and the result that you in your exhibit, Mr. Newell, arrive at is that the Southern Pacific would make out as well under this proposed arrangement as they do now—— (3887.)

Mr. NEWELL. Yes.

Exam. ROGERS. But wouldn't it also be of some importance in putting that through to know whether they are making all right now or not?

Mr. NEWELL. Well, if you are speaking of 5¾ per cent return, it would be difficult, and would certainly be a very long tedious study to work out their total returns from all their traffic and separate their capital investment and apply it properly to a particular part of the traffic, and it would be difficult to make a convincing return. I was dealing only with those transcontinental rates which are governed by the conditions across the continent on all the carriers, north and south, and which could not be varied in order to suit the circumstances of any one carrier. I took those rates as governed entirely by other conditions, mostly of carriers having shorter routes—altogether of carriers having shorter routes than the combined Southern and Union. Now, as to the question of adequate earnings, I wouldn't expect on that long-haul traffic it would be possible to earn the same rate of return as on the short-haul traffic, which is large on the Southern Pacific between Oregon and California.

Exam. ROGERS. I didn't know what there was to it. It is too big a problem to make up your mind hurriedly about, but it would seem to me that we attempt to leave the Southern Pacific in status quo, you might say. (3888.)

2148 Mr. NEWELL. That is the intention.

Exam. ROGERS. But I was wondering whether status quo was all right or not.

Mr. NEWELL. By status quo I mean what it would be if they had the Alturas Line. My intent was to leave them there, but——

Exam. ROGERS. All right.

Mr. DEY. Have you anything further to say on that?

A. Well, I think that the answer to Mr. Examiner's question is in the auditor's exhibit. If all of our returns and all of our expenses leaves us 5¾, that is the answer.

Comr. McMANAMY. That is the answer as to all traffic?

A. Well, I can't say that every unit of traffic must contribute at the same rate. Some will bear only the out-of-pocket cost, and some of it is quite profitable.

Comr. McMANAMY. Have you developed a satisfactory method for determining out-of-pocket costs?

A. Well, I just do the best I can. (3889.)

Exam. ROGERS. Well, that is what we are trying to do here, isn't it, in Exhibit 16 and in your exhibit, in determining the actual out-of-pocket costs?

A. That is what we are talking to.

Mr. McCULLOCH. May I ask just one question, please, Mr. Dey?

Mr. DEY. Yes; certainly.

Mr. McCULLOCH. Have you reached any conclusion about the propriety of the unit cost for resistance that Mr. Newell has used in his exhibit 16, whether that is too high or too low?

A. Well, that was too high.

Q. You feel that is too high?

2149 A. That is, the unit cost, I feel, is too high.

Q. And have you reached any conclusion as to his gross ton mile unit, cost unit, whether that is too high or not?

A. Just by inference, with his method of setting out his direct expenses, he uses percentages that are too high, then when you divide by the number of units I would expect that all of the units would be affected downward.

Q. Now, you figured that all of his cost units were to high?

A. All of those that I examined were too high.

Q. Did you mean all of them?

A. No; I testified a moment ago that I thought I had covered about 75 per cent. (3890.)

Q. Well, I wasn't talking about the accounts. I was talking about his cost units.

A. Well, he gets the units after he gets the costs in the direct, by mere division. I haven't changed his units any.

Q. Well, his units were train mile, car mile, gross ton mile and resistance. Now, you——

A. Yes; he developed the total number of units on the Short Line Railroad, Oregon Short Line——

Q. Yes.

A. And then after he had developed his direct costs he merely divided, so that if the direct costs were changed and the units remained the same, then his base costs there would be correspondingly changed.

Q. You mean that all of his cost units would be too high?

A. Should be revised downward.

Q. Ought to be revised downward, because you think they are too high?

A. That is the answer.

2150 Q. Well, now, have you reached any conclusion as to the propriety of their relationship to each other? That is, even if they are all too high, is their relationship to each other wrong? Take on page 67 there, you see for that haul from Eugene to Crescent Lake, that loaded haul, he has attributed $1.09 to the train-mile cost unit, $2.49 to the car-mile, $1.73 to the gross ton-mile, and $20.61 to the resistance cost (3891) unit. Now, in your judgment, is there any impropriety in the relationship of those cost units to each other, assuming that the total cost is too high, as you claim?

A. Well, I haven't investigated that thoroughly.

Q. All right.

A. But I think that Mr. Newell has pursued a good method in breaking up his units into these different factors, and I haven't made any criticism of the percentages that he has made in dividing the costs between the different elements.

Exam. ROGERS. Mr. Day, I just wanted to ask you one question. You talk about the one-third of the maintenance of way and structures expense as varying with traffic, or with use. Do you think that is about the proper figure when taking over the large number of carriers, or is that all one carrier?

A. I think when you apply that schedule to maintain line operations it will result generally in a figure that is higher than one-third.

Exam. ROGERS. About how much?

A. Well, on our busy lines it runs up to close to 50 per cent. It is different, you see, it is different on different lines, depending upon the movement of traffic, and it also depends on the grades and curves in the line. (3892.)

Exam. ROGERS. Would you say it would run between 33 and 50 per cent?

2151 A. That would be the range, I should say.

Exam. ROGERS. I assume if you were testifying in a rate case you would say about that same thing?

A. I try to be honest.

Redirect examination:

Q. (By Mr. DEY.) In order that there may be no misunderstanding, Mr. Day, with respect to your Exhibit 108, which is labeled, "Correction of Mr. Newell's Exhibit 16, as shown in Table so-and-so," is that intended to be a complete and thorough correction by which you wish to be bound or not?

A. No; not at all. It is rather a hop, skip, and a jump at it, you might say. That is, I have studied about 75 per cent of the items, and I see they are too high, and then I draw the conclusions that—(3893.)

Q. Now from the study that you did make and in arriving at your 33⅓ per cent reduction, was that percentage conservative or

not with respect to what was revealed to you by such examination as you made?

A. Well, I have a deep feeling that I have been particularly fair in this. If I had to produce a figure for my superiors to show what I would be willing to attempt as the out-of-door cost, I would be afraid to go as high as this figure that I have now without a detail study.

Q. That is, as high as the 66⅔ that you have allowed them?

A. That is the figure that I refer to.

Q. Yes. In other words——

A. That is, if the company were faced with the problem of deciding to lose the traffic or hold it to itself, I would be afraid to use as high a figure as that as the cost and say it would not be profitable when it got to that figure.

2152 Q. Yes. Now you gave some testimony this morning with respect to a 41 per cent division. Now that, as I understand your testimony on cross-examination, was carrying one step further the exhibit that you introduced at the request of the examiner?

A. That is just carrying on the assumptions that he wished carried out, that the empty-haul feature that Mr. Newell said was cut out and then these other corrections made to it.

Q. Then you carried it on to show that instead of a division of 27 per cent, assuming that your Exhibit 108 is approximately (3894) correct, you would have to have 41 per cent to make the Southern Pacific whole?

A. As to that particular haul.

That presumes that we handle all the empties up to Crescent Lake for nothing; that is, this exhibit.

Exam. ROGERS. Let me see if I get that straight. This 47 per cent division—is that the figure?

Mr. DEY. 41 per cent.

The WITNESS. 41 per cent.

Exam. ROGERS. This 41 per cent division would not include any compensation for bringing the empties up from California to Oregon?

The WITNESS. That is it; yes.

Mr. DEY. Well now, I don't understand that. You are bringing them up now, aren't you?

A. Yes. We are getting the long haul for bringing them up.

Q. But if 41 per cent would make you whole on your present method, why wouldn't that include the cost of hauling these (3895) empties up?

Exam. ROGERS. That is the way it seems to me.

Mr. DEY. Yes.

2153 The WITNESS. No. The calculation covers the expense without any backhaul, and it results in a net without and backhaul, and the cars are up there now, of course, but as to this movement across there they are not figured in the calculation.

Q. Yes; but if the Southern Pacific is given the same net that it now gets when it performs now this northbound empty car haul from California, why can't it continue to make that car haul just as it is doing now and with this 41 per cent of the division be as whole as it is now and perform the same free empty car service that it is performing?

A. Well, that is true, but now we are hauling cars up there and we would have to continue to haul them up there.

Q. Yes.

A. But we are not being paid to haul them up there, in addition to delivering them to the Union Pacific on the short haul. That is, if the Union Pacific hauls their cars from somewhere else we would not haul them up to Crescent Lake.

Q. Well, if the Union Pacific hauls them from Ogden or Omaha and relieves the Southern Pacific Company from hauling them up into Oregon, and then you still get a 41 per cent division, you are being made whole and being relieved from performing an empty car service north, aren't you? (3896.)

A. Well, we are substituting that empty haul for another empty haul; that is all.

Exam. ROGERS. Well, as you are calculating now the 41 per cent takes care of the empty haul?

A. I haven't got that into the picture. We can't tell by changing this routing, the methods of routing, we can't tell what effect it would have on the Southern Pacific, whether it would increase our empty car movement or decrease it.

Mr. DEY. Oh, I see.

2154 Comr. MCMANAMY. Is that properly a part of the picture? Your rate covers the movement of the traffic into southern California and unloading it and disposing of the empty?

A. Yes; I think it is part of the picture. I think to complete Mr. Newell's study he would have to invent a system of getting his empties out here some other way, and what effect it would have on our own, that would be an impossible task to determine.

Mr. DEY. I see. You figure if you don't haul them north you have got to haul them down to El Paso or some other place, and therefore it washes; you have to do the same amount of empty car haul anyway?

A. I don't know whether it washes, but there would be a change and it would take a long time to develop that.

Mr. DEY. I see; as long as we get it clear. (3897.)

2155 G. J. SIELAFF was thereupon produced as a witness on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

My name is G. J. Sielaff. I am a geologist for the Southern Pacific Company. I have been in my present capacity for the last 3½ years. Previous to that I have been in the mining business for

the last 28 years. I graduated from the School of Mines, the Nevada School of Mines, Nevada State University, in 1900. I have been practicing my profession continuously since (3898) then for 28 years, excepting for one brief period of one year. The nature of my experience has been operating mines, making examinations of different prospects throughout the country in different States. I have been with the Southern Pacific Company altogether 9½ years, but I have been with them a little over 3 years, in my present capacity. I do nothing but geological work.

I know where Alkali Lake is over in central Oregon. I have been there three times, in October, 1927, the first of July, 1928, and again the 15th of August, 1928. I went there the first time in 1927 to attempt to determine the relative merits or the value of the soda deposits at Alkali Lake. I took an assistant with me. (3899.) When we got there we made a general reconnaissance of the entire lake, went around it; then we noted these pothole areas, marked them and mapped them out, laid off certain areas in them where the potholes were apparently the thickest or occurred most frequently, measured that area out, measured each of the potholes in that area, determined the area of them; and we also drilled holes in 11 or 12 of these potholes to determine the extent or depth of the deposit of sodium occurring in these potholes. We also drilled the area between the potholes and the areas outside of this pothole area.
2156 At that time we drilled 10 feet to 10 feet 4 inches. On the last trip I went through practically the same thing again, except that I drilled several holes to a depth of 20 feet 8 inches. On the middle trip, July of this year, I drilled holes in the pothole area, right in the pot (3900) holes themselves, to determine the thickness of the salts in those areas. I had instructions from the headquarters of the freight department to go there to determine, if possible, what was located, what the extent of the soda deposits at Alkali Lake was.

Q. (By Mr. Dey.) You went over there at a request which originated from me, didn't you?

A. I believe so.

I did not know at the first when I made this analysis what it was going to be used for. I came to know this before I had made my report, the exact date I do not remember.

I found in these pothole areas a crystaline compact salt; that is not a common salt, as the term is definitely applied (3901), but composed of various salts. With respect to the purity of the products that I found there: They contain, as a whole, a higher percentage of sodium carbonates than most deposits which I have visited or have knowledge of. Soda ash is a calcined sodium carbonate; that is, when it is relieved of the water.

Q. Well, do you find any soda ash over there?

A. Not as such; no.

Soda ash is composed entirely of sodium carbonate, with minor amounts of impurities, but the salts as contained there, according

to my analysis of a bulk average, show approximately (3902) 81.61 per cent of sodium carbonate; that is dried, recalculating, by leaving out the moisture or the insoluble content, such as deleterious substances which might have been blown in on the lake, that average analysis would show 81.61 per cent of sodium carbonate, about 7.6 per cent of bicarbonate; it would show 2.74 sodium chloride or
2157 common salt; it would show sodium sulphate 1.99; potassium sulphate 1.78; calcium carbonate, which is carbon lime or limestone, 1.68; magnesium carbonate 2.33; borax 18 per cent, and sodium phosphate .03 per cent.

I found no soda ash as such over there. As to how many thousands of tons: There is no such soda ash as such. I did not find anything over there in very large quantities, or in any quantity, that could be heated up and dried out and would then become soda ash.

Q. A pure marketable product?

A. No, sir; not as soda ash.

It is an impure soda or crude salt. To make soda ash out of it you would have to go through a complicated chemical process. (3903.) That would cost on the basis of costs around the Owens Lake country, from $15.00 to $17.00 per ton. The salt as gathered from Alkali Lake can be marketed as crude soda. There is limited use for crude soda in the market. As to whether it compares at all with the use of soda ash: Only in some establishments where the requirements for purity are not as fixed as in most of the larger establishments. The proportion of that used is very small as compared with the amount of soda ash that is used.

Q. Well now, Mr. Emerson, H. L. Emerson testified in this case; I don't remember the exact testimony, of course, but the effect of it was that there were thousands of tons of material over there that, when dehydrated, was marketable soda ash as pure or purer than anything else that is found anywhere in the country. What have you got to say about that?

A. There is not. I will qualify that in this way: If considered from natural deposits, it has as high or higher sodium content than any that I know of, but that is all. (3904.)

2158 It has not the purity that relieves it from further processing, not as a soda ash. That would cost from $15 to $17 per ton to handle by the modern methods that are applied to that sort of product. It would be a hard question to answer what would have to be done to that material to make it marketable as soda ash, owing to the fact when you consider the immense amount of money and equipment that has been spent at the plants around Owens Lake and Searles Lake country in working out a definite process for the beneficiation of those deposits. They spent millions of dollars in testing, and the like, until they have evolved a process that was suitable for their deposit. But in general the process would be to dissolve these salts in a thick enough brine and probably filter to relieve of the silicas and the insoluble content, and then passing

carbon dioxide through the solutions and carbonating the sodas as sodium bicarbonate, which is not very soluble in water or solution in water. This sodium bicarbonate is then calcined to make soda ash. Wherever they have found a (3905) natural deposit, there are general principles of refinement that apply, but they must refine that process down to a point where it will treat this particular deposit. That is, there is a variation in these deposits that requires special application in each case, and it takes money to find out what that special application is.

As to what would be the factors in the cost of production to produce soda ash from the Alkali Lake deposits: First, the salts would have to be gathered either as the solid from these potholes, or it would have to be blasted or upon some means of taking the solids out from the potholes, or by making a large sump in some way and putting these salts in solution, drawing them to a natural reservoir, and that would be an excavation—not natural but artificial.

2159 An artificial reservoir. Then the brines would have to be allowed to remain there until the dust or insoluble settled out of it; either that or put through a filter press which would remove these insolubles. After that they would have to be evaporated (3906) according to the present procedure; they would have to be evaporated and the salts removed by evaporation. That is, if just the crude product were desired. If not, the brines could be subjected to some chemical process in order to remove the desired product. And then you have a marketable product, located at Alkali Lake, that has to be transported to market somewhere. That price of $15.00 or $17.00 a ton that I gave is the cost price at plant.

I have investigated the costs of other producing points where they produce from the natural mineral in so far as I have been able to, but as there are only a few, very few of those plants of that nature, all of which are located in California, there is a certain reserve amongst the superintendents, which do not desire to let out trade secrets, which would be of that nature, by exposing or giving away their actual costs.

Soda ash is produced in another way than by mining and refining; chemically. (3907.) The principal process for the production of sodium carbonates to-day is known as the Solvay process, or some modifications of that Solvay process. By this process a saturated brine solution, treated with ammonia, then subjected to a treatment of carbon dioxide, produces sodium bicarbonate, which, in turn, has to be calcined to make sodium carbonate or soda ash. They apply common salt, sodium chloride, to this Solvay process to make soda ash.

As to how much of the soda ash produced in the United States is produced by the chemical process, and how much of it comes out of these so-called deposits which are scattered over the country:

2160 In 1921 natural soda produced in the United States amounted to 1.39 per cent of the total soda ash produced; in 1923 there

was 0.872 of one per cent. It would be less than one per cent. In 1925 it was 1.355 per cent. That is the latest figures (3908) which are available at the present time. There is 98 per cent or better of the soda ash used in the United States that is made from common salt by chemical process. So far it has been much cheaper to produce it that way than by trying to refine such deposits as we found in Alkali Lake. The costs that are given are approximately $8.50 per ton by the Solvay process. As to the comparative selling prices of this commodity coming from these two different sources, one by chemical process and one by refinement of mineral deposits: As a general rule, the soda ash made from the natural deposits is not as pure as the soda ash made by the Solvay process, and its ruling price runs from $5.00 to $6.00 less per ton. It depends on the purity.

I have read Mr. Emerson's and Mr. Young's testimony in this case. (3909.) As to the conclusion I draw from their testimony, I would say they are overly optimistic.

Q. Just describe to the commissioner and the examiner what you found as you bored down in these drill holes, what you got out of there. Just take any typical hole.

A. We found that the actual thickness of the salts, what might be described as the west area, which roughly outlines the potholes in the western portion of the deposit——

Q. Take the best area you found.

A. That average thickness of the salts in those potholes was 3.69 feet. In the other area, or the east area, the average thickness was approximately 4 feet 4 inches, although a hole which I drilled later, along about the 15th of August, showed only 3.6 feet. That is about the average. That is the crust filling the potholes.

2161 Q. What do you find then below that?

A. Mud, containing salt crystals.

Q. What?

A. Mud and slime containing salt crystals. This goes down to approximately 9 or 10 feet. Sometimes it varies. Below this is clay. (3910.)

Q. Now in your 25 years of experience in geological and mining work, in your opinion, from the three separate examinations that you personally made over there, do you believe that that property affords an opportunity for commercial development——

A. I do not.

Q. Wait a minute—that will have any fair chance of competing with the soda ash produced in other localities and by other processes, or by all known processes?

A. I think it would be unable to compete.

Q. How much soda ash is used in the United States?

A. Approximately 2,900,000 tons.

Q. Annually?

A. Wait; I may be off on that. In just a minute I will give you the figures. About 1,900,000 tons; for 1925 the total ash produced was 2,471,868 tons.

(Cross-examination of Mr. Sielaff to proceed after Witness George M. Duncan has been examined.) (3911.)

GEORGE M. DUNCAN was thereupon produced as a witness, on behalf of defendants, and, having been duly sworn, testified as follows:

Direct examination:

I am in the manufacturing and wholesaling lumber business.
2162 We operate a mill at Dryad, Washington, in Lewis County, where we produce about 30,000,000 feet of lumber annually. We market the product of that mill, and in addition to that we buy and sell lumber, and sell and buy lumber. The lumber that we do not produce we buy in Oregon and in Washington, and in rare instances, in British Columbia. We buy, I would think, from 600 to 1,000 cars a year in western Oregon—depending upon conditions. This lumber is purchased generally from the mills, large and small, in the Willamette Valley and other parts of western Oregon. (3912.) We handle the routing of this lumber.

Q. Is it a fact that most of the small mills sell to wholesalers, such as yourself?

A. Yes. The marketing area of lumber, particularly fir lumber, is very large. The small mill, the mill with a small production, in fact the mill with a medium size production, can't afford a selling organization to cover all of that territory; it would make his unit selling costs too great. Consequently, those mills invariably market their product through wholesalers and commission men, and so forth and so on. In other words, they don't maintain a complete sales organization of their own.

I know the Bohemia Lumber Company. We have bought lumber from them.

Q. Now the lumber that you purchase in western Oregon is routed how to eastern destinations, back in the Middle West, say, beyond Granger, Wyoming?

A. We route the most of that lumber through Portland and the (3913) Union Pacific.

Q. Why do you do that?

A. Well, Mr. Dey, it is the policy of my concern, and a policy of my own, to reciprocate the business that I get from other railroads. I sell the Union Pacific lumber; I try to reciprocate by routing tonnage via their railroad. That is why.

2163 Q. Do you sell lumber to the Southern Pacific Company?

A. Very rarely.

Q. Do you route any of these shipments through Odgen?

A. Occasionally, yes; but rarely.

Q. In routing your shipments, do you take into consideration the length of haul that may be open to you by one gateway as against another?

A. No; we don't. We find that the difference in time of deliveries is not of moment. Lumber moving by the way of the southern route through Ogden, lumber moving by the way of Portland through the Union Pacific, going to eastern points, the difference in delivery has never been of any consequence to us or to any of our customers.

We route the lumber that is manufactured by us over in Washington on the same principle exactly. Our mill is located at Dryad, Washington. We have two lines serving that plant. Each of those lines patronize us with their lumber requirements. We divide our tonnage as between those two initial (3914) lines proportionately to the business that we secure from them, and then we route beyond those initial lines to favor other lines to whom we sell lumber, such as the Chicago & North Western, the Minneapolis & St. Louis, the Soo Line, and so forth and so on.

Q. What has been the experience of the lumbermen in western Oregon and the lumbermen in western Washington during the time that you have been here, with respect to prosperity or a lack of it in the industry?

A. Well, Mr. Dey, it is my observation that the lumbermen in this area in the 16 years that I have been here have had no prosperity, except a short period after the war, when there was an exceptionally heavy demand of lumber created through war conditions. That was, as well as I remember, in about 1920 and
2164 1923. And during the 16 years that I have been here, I don't believe that there has been a reasonably prosperous era for the manufacturers of lumber to exceed 6 months; at any rate, not to exceed 12 months. (3915.)

Q. At a time?

A. At a time.

Q. How do you account for that?

A. Well, we have too much lumber; that is why—too much lumber being produced.

Q. The testimony in this case shows that the timber belt of Washington has been depleted proportionately more rapidly than the timber belt of Oregon. In your opinion, has that been a good thing or a bad thing for the State of Washington, and why?

A. I think it has been particularly unfortunate for the State of Washington, for this reason: I think that, in round figures, approximately 66⅔ per cent of the original stand of timber in Washington has been harvested. No profit has accrued to the State of Washington out of that harvesting. The natural resource has been cut away. There has been profit that came out of it to establish other industries to give employment to labor, to take the place of timber in paying taxes, and so forth; and, as far as I can see, Washington has got no benefit out of it of consequence. But the States that have no timber, like Kansas, Nebraska, Missouri, and that country over there, have got a benefit out of it, in that they have been afforded cheap lumber to build houses for (3916) their citizens.

Q. What is the situation with respect to the logged-off areas in Washington and in Oregon—what takes the place when the timber crop is gone, or up to date what has taken place?

A. Well, a little farming, and a very little. I have, and anyone who has, will notice in driving, say, from Seattle to Everett, and from Everett to the British Columbia line, or driving from
2165 Seattle to Grays Harbor, around Montesano, or driving from here to Chehalis, and from Chehalis out to Raymond, you will see that vast areas of cut-over timberland that is doing nothing, absolutely nothing, producing nothing. It is a burden to the people who own it. Their taxes are actually more than the land is worth.

It costs quite a bit of money to clear that land from stumps and stuff of that sort and put it into farming; and if it was into farming we have no one here to consume the products. Consequently, that area that has been denuded of this forest is just lying idle, and in my judgment will lie idle for many years yet.

Exam. ROGERS. Are your taxes reduced when the timber is cut off?

A. Some, yes; because the land has a less value than the land with the timber on it. (3917.)

I think, Mr. Dey, the general consensus of opinion is that the quality of the timber in Washington was better than the quality of the timber in Oregon. Yes; I would think that that fact had something to do with the more rapid cutting of the Washington timber, because at an equal price your opportunities are better with a better raw product than they are with an inferior raw product.

I was in the lumber business in Louisiana and Texas before I came to Oregon.

Q. Then when you came here and looked over the Oregon and Washington timber belt, you would naturally, at the same price, locate where the better grade of timber was?

A. Naturally.

Q. There has been some suggestion in the record in this case, I believe, that it is necessary, or whether it is in the record or not, what have you to say with respect to any claim that there
2166 are vast quantities of timber now ripe or overripe that requires cutting in order to salvage it? (3918.) And what are your ideas with respect to such timber?

A. Well, my own judgment is that that is largely theory; that after these forests mature there has always been more or less ripe timber. I believe the foresters hold that a forest reproduces itself about as fast as it becomes overripe and decays and goes out.

But, regardless of that, the fact that there might be ripe timber I don't think is any justification for taking that timber and harvesting it at a loss, and naturally you are not going to harvest only the ripe timber because the ripe trees grow right around with the other trees, and this timber being large, the country being rough, your logging operations necessarily must take everything that there is there. You simply can not do selective cutting in these forests.

Consequently, if you start in on the theory of harvesting only the ripe timber, you must necessarily harvest the other timber as well, and your other timber will be far in excess of the ripe timber; then you are cutting away good timber at a loss to salvage a little ripe timber, also at a loss. (3919.)

Cross-examination:

Q. (By Mr. McCULLOCH.) Mr. Duncan, on what lines of railroad is your mill at Dryad located?

A. On the Chicago, Milwaukee & St. Paul and the Northern Pacific.

We buy approximately the same amount of lumber in the State of Washington as we do in Oregon. We buy some of these 600 to 1,000 cars a year in Oregon, from mills at Portland.

Q. Is the lumber that you buy, or the bulk of the lumber that you buy, as a wholesaler, in the State of Washington bought from mills that are located on the lines of more than one railroad?

2167 A. No, no; I don't think so. There are quite a few mills up there located on one line.

Q. Do you find in your business as a wholesaler that it is of any advantage to have the opportunity of shipping lumber that you buy to eastern destinations over more than one route?

A. Not now; no.

Q. Why is that?

A. Well, the principal advantage that in the past the having of more than one line was during times of car shortage. We have had nothing like that for the last several years, and (3920) inasmuch as the mills are supplied with ample equipment, there is no advantage. The rare circumstances might occur where we could buy a car of lumber from a mill located on a single line that we couldn't fill a certain order with account of the tariffs of that line not permitting us to get into destination on the proper rate, but in each instance we can always buy it from some other mill located somewhere else that we can get into destination on the competitive basis.

Q. Well, in that respect your situation as a wholesaler would be a bit more advantageous than that of a manufacturer who was selling his own product and had only one point from which he could ship, wouldn't it?

A. From that standpoint, yes.

Mr. DEY. That is, assuming there was a different rate structure, though, that applied to his mill than applied generally on the coast?

Mr. McCULLOCH. No; not assuming that there was a different rate, but the same rate—that is, that his mill took the coast rate to eastern destinations, as well as other mills.

A. Well, now, I don't get that just exactly, Mr. McCulloch.

2168 The advantage would be if—if from this mill, we will say, the rate was 72 cents, and from this other mill the rate was 73

cents, naturally the advantage would be with the 72-cent rate mill. (3921.)

Q. No; but I was thinking—you are talking about the rate to Chicago. The rate from most of the points where fir mills are located in Oregon and Washington is the same to Chicago?

A. Yes.

Q. That is 72 cents?

A. Yes.

Q. But a wholesaler—my point is this, that a wholesaler in buying lumber and then reselling it and shipping it east, if for any reason apart from rates—I mean competitive rail service, or inability to use a particular route to make delivery—he finds it inadvisable to buy from a particular mill, there are a great many other mills from whom he can buy, isn't that true?

A. Yes; the wholesaler has this advantage, that he has every mill as a shipper for him, while the individual mill has only itself.

Q. Yes. Now, in these times of car shortage that you mentioned a number of years ago, did this ordinarily occur in times when demand was strong and prices were good?

A. That condition made prices good—the car shortage.

Q. You mean the car shortage was the cause of increased demand and better prices?

A. Not exactly increased demand, but it made better prices (3922), because lumber was more difficult to get on the part of the distributor, and those who could get the cars and could furnish the lumber would naturally get a better price than if lumber was easy to get and he could get them anywhere.

Q. And were the beneficiaries in those better prices in those times those that had competitive rail service, generally speaking?

2169 A. Well, it was the mills that could secure the cars, and back in those days, the mill that had two lines could probably secure more cars than the mill who only had one car. I don't know that that condition would exist now.

Q. Does your company as a wholesaler, or your mill at Dryad, receive a good many orders calling for immediate delivery?

A. I will say for the last 12 months, or probably longer, practically every order is for immediate delivery.

Q. What time would that contemplate, then, an order of that sort, in getting a car of lumber from your mill at Dryad, to Chicago, for example?

A. Well, immediate delivery in lumber parlance has nothing to do with the time of delivery at destination.

Q. It doesn't?

A. It is time of shipment, and I believe what is known as west coast terms say that prompt shipment is within 30 days, and immediate shipment, I think, is within 2 or 3 weeks. (3923.)

Q. There is one other witness who testified yesterday. I believe, a lumberman, that this phrase "immediate delivery" in the trade meant shipment from the mill within 10 days of the receipt of the order.

A. That may be true.

Q. Do you know about how long the time in transit is from western Oregon and western Washington of a car of lumber to Chicago, in your experience?

A. Well, I have never had occasion to really check into it, Mr. McCulloch. I only know in a general way. I think shipments are going through to Chicago now in somewhere around 2 weeks, possibly a little longer.

Q. In recent years has there been any change in the way of accelerated movem nt of lumber to eastern markets from
2170 these points in western Oregon where the mills are located, and western Washington? Has the movement been appreciably speeded up?

A. Without doubt, I think we are all cognizant of the fact that the railroads have very materially increased their efficiency in the last few years in the matter of getting stuff over their lines, taking them through.

Q. Has that resulted in any change, in your observation, in the practices of the retail lumber yards of the East and lumber purchasers generally in buying their requirements of lumber on the west coast? (3924.)

A. Yes; it has resulted in a change that, in my judgment, has been rather to the disadvantage of the producers of lumber, in that before the railroads improved their efficiency an ordinary shipment, say, that goes through to Chicago, say, in two weeks, or goes through to Minnesota Transfer in, say, two weeks, that shipment would be enroute 3 and 4 weeks, maybe longer, sometimes 30 days. Under those conditions the distributor of lumber necessarily had to anticipate his requirements for his local trade. That forced him to carry a much larger stock than he carried under present conditions. The speeding up of this service on the part of the railroads enables now the distributor to carry practically no stock, get his shipments promptly, get his deliveries promptly, and consequently that burden is now put upon the producer. We must carry the stock that formerly was carried by the distributor.

Comr. McManamy. Well, is it your thought that the western producer of lumber would be better off to-day if he had an occasional car shortage and that time of delivery was substantially lengthened?

A. As a comparison with the old days; yes.

Comr. McManamy. Why the comparison with the old days?

2171 A. As a comparison with the conditions back when we had these (3925) car shortages, probably yes, but you must bear in mind that there are other factors in connection with that. In the days when we had this longer delivery in time, took much more time than it does now to get the shipments to destination, there was a practice on the part of a good many wholesalers to buy lumber which wasn't sold, put it in transit, use the railroad cars for warehouses, which further accentuated the car shortage, and then they would sell that lumber while it was in transit. They had ample time to dispose of it. The man who knew the requirements of a certain area would sense a probable advance and he would go out and buy, I will say for illustration, a hundred cars of lumber of different assortments that he thought would fit the trade conditions where he sold his

lumber. That lumber would be in transit, we will say, going to Minnesota Transfer, at least 30 days. In that 30-day period he would sell that lumber. Now he can't do that, because he hasn't time to sell it while it is in transit. Attempting to do that now would result in a great many possible cars going on to demurrage, and at the increased demurrage rates his profit would be more than wiped out, so that particular practice in lumber has been cured. With it has come the other matter that I spoke about, the distributors carrying less, limited stock, and putting that burden on the manufacturer; so of the two, the transit of lumber was by far the greater evil.

Q. (By Mr. McCULLOCH.) And you say that this has substantially (3926) disappeared?

A. That has substantially disappeared in rail shipment; yes.

Q. Now, have those conditions that you have just described led the producers of lumber in the East to insist on more and more prompt delivery of their orders to them?

A. Yes. I don't know whether that did it or not, but the 2172 distributor of lumber, the retail merchant of lumber, carrying a much less stock than he did in the past, having less lumber to supply his trade, necessarily must have very prompt service to keep that condition as regards his own stock, but so long as we continue to overproduce lumber on this coast, produce more than the market will take, so long as we don't keep our production fairly well balanced with consumption, that condition will still exist.

Q. Mr. Duncan, would you say that, in view of these present conditions, a saving in time in transit of 48 hours on a car of fir lumber to a point in Illinois or Iowa or territory around there would be considered unimportant or of no consequence by the eastern retailer or producer?

A. I don't think it would. I have been in the retail lumber business, several years ago. Forty-eight hours is not a long period of time in the matter of constructing a house or building a pig pen or building a chicken house, or something of that sort.

Q. Well, you think then, that the ability to get a particular (3927) car that was needed in a hurry, of items that a retail lumberman in the East had a demand for that he wanted to supply, do you think that a saving of 48 hours in the ability to get that by using a particular route would be considered by him to be of small consequence?

A. Well, there are rare instances, of course, when it would be of considerable moment to him, but as a general proposition—I am talking about the general business—of course—I don't think it would amount to much.

Q. Now, in the routing of cars of lumber your company ships as a manufacturer, or as a wholesaler, to the East, do you consider, in determining which particular route you will specify, the 2173 length of the route of the time in transit by the various

routes? Do you take that into account at all in determining the routing?

A. No. We may be rather peculiar in that respect, but the main thing that we take into consideration is being able to route that tonnage over the railroads whom we consider friendly to us and who we do business with. That is the sole factor with us.

Exam. ROGERS. Do you do that although you pay a higher rate by one route than you do another?

A. No; we will always do that on an equal rate.

Q. Would it be equally satisfactory to you as a manufacturer if your mill at Dryad were served by only one railroad, instead of two? (3928.)

A. No.

Q. The competitive rail service, then, is of real benefit to you as a lumber manufacturer?

A. In this respect—by having two lines at our mill we have two opportunities to sell lumber where we would otherwise have one. By having two lines we might in rare instances have a litle bit better service. In the past, in the old days that I am talking about, two lines were of great benefit as compared to one, but, while I am operating now a mill that has two lines, it is my observation that the mills who have one line get just as good service as I do out of two.

Q. Would you say that for the same reasons as you have given affecting your mill at Dryad the construction of the line of railroad proposed here from Crane over to Crescent Lake, affording a new through route to eastern markets, would be of substantial benefit to the lumbermen in western Oregon, the opportunity of having a through route, and to that extent competitive rail service, to the East?

A. From a lumber standpoint, Mr. McCulloch, I couldn't see that (3929) that would be of any benefit whatever. The road
2174 through there might be a benefit to this area over in eastern Oregon, it might be a benefit to some other industry, but, frankly, from a lumber standpoint I can't see it; I don't believe that it would. The fact that it would open up more lumber territory I believe would be a detriment.

G. J. SIELAFF was thereupon recalled to the witness stand, and testified further, as follows:

Cross-examination:

Q. (By Mr. ELLIS.) I understand you have been employed by the Southern Pacific Company for the past several years, Mr. Sielaff?

A. Yes, sir; about—over 9 years. My work has been varied. First, I was employed by the land department as a land examiner; afterward, subsequently, I was taken to Texas on construction work, putting up oil tanks and doing geological work in the oil field. I returned to California (3930), ran the oil shale plant out in Elko,

Nevada, when the oil shale experiments were being conducted—extracting oil from shale. Subsequently I returned to Texas again on similar work, engineering, to work in the oil fields. Three years and a half ago I was called to San Francisco to assume my present position.

In my present position I make such examinations as requested, to report on the character of rocks for ballast, the character of locations for dam sites, and work of that nature. I am a mining engineer. I do not profess to be a chemist or chemical engineer.

2175 Prior to being employed by the Southern Pacific Company I was engaged in the mining business. In that business I spent six and a half years in the Tropics, in Central America (3931) as superintendent and general manager of various properties. In the United States I made examinations in nearly all of the Western States. The mines I was connected with in Central America were gold and silver properties.

I was never employed by any company engaged in developing soda deposits.

Q. Prior to your investigation in this case, did you ever have anything to do with the investigation of a soda deposit?

A. I investigated other soda deposits, other saline deposits, since my employment by the Southern Pacific Company. I investigated the deposits at Double Springs in Nevada, Rhodes Marsh.

Q. Are those Double Springs located at Ragtown, Nevada?

A. No, no; that is out east of Schurz, 7 miles east of Schurz, Nevada.

Q. (By Mr. DEY.) Where is Rhodes Marsh?

A. Seven miles east of Schurz, Nevada.

Mr. DEY. Where is Rhodes Marsh that you mentioned?

A. Rhodes Marsh is situated south of Mina, or close to (3932) Sodaville, or what we might call Tonopah Junction; it is right at Tonopah Junction, in Nevada.

I have been at Owens Lake and at Searles Lake, also. I had a chemist make a chemical analysis of the Alkali Lake deposit. The first analyses were made by G. L. Baxter, the chief chemist of the Southern Pacific Company, and other analyses were made by Abbott A. Hanks. He is a chemist in San Francisco.

Q. (By Mr. ELLIS.) So the testimony you have given here as to the purity of the deposit of Alkali Lake is based entirely on the analysis made by these chemical engineers?

A. Yes; on samples taken by myself. Some of these samples

2176 were taken in the potholes, and some in the areas surrounding the potholes. I took a total of 18 samples. (3933.)

Q. And was this analysis which you read into the record a composite of all of those 18 samples?

A. The calculation of them, which would be a composite of all those sample. It wasn't a general mixture of the samples, but a summation and an average of the various samples.

Q. In taking the samples, did you try to get some that would be pure, near the center of the pothole, and some that were out on the margin, where there was a greater percentage of impurity, in order to get an average of the total lake bed?

A. I took samples right in the center of the pothole, where the salt was thick and dense. Other samples were taken between the potholes, to show the amount of salt that might be contained in the clays.

Q. Then your samples as taken and the analyses which resulted would assume that a commercial development of that lake would be made by taking not only the deposits from the potholes, but the mud and other impurities that you find between the various potholes; is that not true? (3934.)

A. In making a commercial development they would have to take as much as all of the salt process, whether within the potholes or in the saturated earth surrounding the potholes.

Q. (By Mr. ELLIS.) Would it not be practical to merely remove the deposits from the potholes and ignore the mud portion of the lake?

A. It wouldn't economically; no.

Q. If you take, or have an analysis made of the deposits in the pot-holes separate and apart from this composite which you say your figure of 81 per cent resulted from?

A. Yes, sir.

Q. And what percentage of sodium carbonate resulted from
2177 that analysis?

A. A sample of the salts which were extracted from one of the potholes and piled up on the side—I don't know by whom, but somebody who evidently had attempted to operate there—an analysis of that sample gives 2.08 per cent sodium chloride, 3.17 per cent sodium sulphate, .31 per cent potassium sulphate, 52.81 per cent sodium carbonate, 11.42 sodium bi-carbonate, and .11 borax. (3935.)

Q. Do you know where that sample came from? Do you know that it came from one of the potholes?

A. That I couldn't say that it had. It was piled up alongside of the pothole, as if it had been taken from the pothole; but I have other samples which were taken right out of the potholes. They produce a similar result, in a general way.

Mr. DEY. Have him give them.

Mr. ELLIS. I have before me a chemical analysis which indicates sodium carbonate to the extent of 96.21 per cent, which I understand to have been made from salts taken from one of the potholes on Alkali Lake, and I am wondering whether you think it would be possible to find salts containing that great a percentage of sodium carbonate in the pot holes on Alkali Lake?

A. In so far as all my investigations indicate, there is no such high grade soda there.

Q. Well, how does the purity of the soda compare with other deposits which you know about?

A. Higher. (3936.)

Q. How much higher? Can you express that in percentage, or in purity?

A. That varies considerably in all the different deposits. There probably hardly are two that are the same, or anywheres
2178 near the same, but I can give you the figures on some of the deposits which shows the general soda content in them.

It is higher than the purity of other deposits that are now being operated commercially. The Owens Lake deposit is the only other deposit I know of that is being operated commercially. I have visited that deposit.

Q. Do you know how much it is costing them to purify the product and make it into soda ash?

A. I have talked with the superintendents of all those plants, but they are all somewhat reticent as to giving the accurate figure. There are only two of them, they are competitors, but in one statement the superintendent of the National Soda Products Company made to me he indicated that the costs of the refined soda ash were $26.00 at that plant. How accurate that is, I cannot say.

Q. Do you know what the commercial value or market price of that soda ash is? (3937.)

A. Yes, sir. The latest quotations which I have made note of, where market prices are based on f. o. b. producers' works, are as follows:

$1.15 per hundred in bulk for light ash, $1.32 per one hundred pounds in bags, and $1.55 in barrels.

For the heavy or dense ash, it is $1.22½, $1.37½ in bags, and $1.55 in barrels.

Q. (By Mr. Ellis.) Where is this plant you have just been discussing located?

A. On Owens Lake, in California. In Inyo County. The National Soda Products Company is located at Keeler, on the east side of the lake. The Inyo Chemical Company is located at Bartlett, on the west side of the lake. Inyo County is in the southeastern
2179 part of California, east of Los Angeles. (3938.) It is reached by railroad.

These properties have been operated since 1914 or 1915.

Q. Could you state the percentage of purity of the product at Owens Lake, compared with the 81.06 per cent sodium carbonate that you found at Alkali Lake?

A. Do you want the manufactured product as turned out there, or——

Q. No; the raw product as you find it at the lake.

A. An analysis of brine at the lake—this first sample was taken before the lake had entirely dried up——

Mr. Dey. What lake are you talking about now?

A. Owens Lake, where the National Soda plants are located. Chlorine, 25.56 per cent; sulphate, radical, 9.96 per cent; carbonate, radical, 22.18 per cent; the borate, radical, 1.92 per cent; sodium, 38.07 per cent; potassium, 2.10 per cent. The total anhydrous salts in the original sample were 10.95 per cent; the insoluble silicate, .21 per cent.

Q. (By Mr. ELLIS.) Then the deposit—the sodium carbonate there—would be 38 per cent, as compared with 81.61 per cent at Alkali Lake? (3939.)

A. No; that is pure sodium stated in the other. The one I have given you at Alkali Lake is sodium carbonate. But you could easily figure out what that would be from percentages.

Mr. DEY. Can you figure it out?

A. It would be approximately 45 per cent—43 or 45 per cent.

Q. (By Mr. ELLIS.) Now, in arriving at your conclusion that a commercial plant was not feasible at Alkali Lake, did you take into consideration the fact that railroad transportation did not exist within convenient reach?

A. I did.

I found no soda ash at Alkali Lake, or at any of these other lakes.

2180 Q. Soda ash does not exist or is not found in its natural state, is it? It is the product of sodium carbonate produced after a chemical process?

A. Chemical process.

Mr. DEY. Right there, Mr. Ellis, didn't Mr. Emerson testify that all you had to do with this commodity as it was mined out was to dry it and you would then have soda ash?

Mr. ELLIS. That was my idea, simply remove the moisture content and you had soda ash at Alkali Lake. He didn't say that of these other deposits. The witness who preceded you, Mr. Duncan, in (3940) his testimony stated quite emphatically in connection with timber of the Pacific coast that the quality—the opportunity of developing a product was better with the higher grade product than it was with an inferior or low-grade product. That same principle would apply in connection with the soda deposit as it would with timber or any other raw product, wouldn't it?

A. We have to have both the quantity and the quality. In that way, the same.

Q. Well, there is no question about the quantity, is there, at Alkali Lake?

A. There is.

Q. Are you the Southern Pacific representative who was quoted in the Lake County Tribune of July 10th as stating that there is enough soda at Alkali Lake to ship out 25 carloads a day for 50 years or more?

A. I am not.

Q. You don't know anything about that statement?

A. I do not.

Mr. DEY. What is there to show that any Southern Pacific man ever made any such statement?

Mr. ELLIS. I merely referred to the article and the quotation and asked him if he was the one. (3941.) Do you dispute the claims of preceding witnesses as to the quantity of the product available?

2181 A. Yes, sir.

Q. How much do you think there is at the lake?

A. That question would have to be divided in what do I consider, or any one consider, the quantity of recoverable salts and the quantity of total salts in the lake. I would say, roughly, that the quantity of recoverable salts would be approximately 500,000 tons, of which 402,175 tons would be sodium carbonate.

Q. What would be the minimum capacity of the plant feasible for a project of this kind, if one were contemplated?

A. The plants around Owens Lake are working for a minimum of 100 tons product. The cost of the product, of course, would depend—the cost of operation, of course, would depend on location and various other factors. (3942.)

Q. Do you think that would be a minimum for a commercial production, a minimum capacity for a practical commercial production?

A. Yes, sir.

Q. Have you any information as to the extent of the deposit at Owens Lake?

A. Yes, sir. Estimates made of the quantity of salts contained in Owens Lake are, chlorine, 40,000,000; sodium, 60,000,000; potassium, 3,360,000; and the anhydrous boric acid, 3,070,00; or a total of 160,000,000 tons.

Q. Are all of those commodities being produced there now marketed and sold, or are they only marketing part of them?

A. Only part of them.

Q. What part are they marketing?

A. Principally the trona, which is the crude soda, and the manufactured soda, and caustic soda. There is one plant making caustic soda.

2182 Redirect examination:

Q. (By Mr. DEY.) Well, now, assuming that there were rail transportation available to this plant, or assuming that this cross-State line were built approximately 20 miles north of Alkali Lake, and that the industry that might be located on the lake for the manufacture of these products built its own railroad up to the cross-State line and thereby got (3943) transportation—with that element an accomplished fact would these deposits down there, in your opinion, permit of a profitable commercial development or manufacturing development, and, if not, why?

A. They would not.

Q. Why not?

A. Because they haven't even the quantity available, and the cost of production would be excessive in competition with the manufactured Solvay soda.

Q. Well, the thing I don't understand, Mr. Sielaff, is how can these Inyo County plants keep going, if a plant up here couldn't do it?

A. They have, as shown by this quantity of salts down there, very large tonnage; they have spent millions of dollars in developing and perfecting processes for the manufacture of that soda.

Q. Oh, I see—that the quantity up here wouldn't justify the expenditure of capital necessary to give a long operating return upon that capital, is that right?

A. To carry them through a period of experimentation and the development of a process for the extraction of that soda.

I couldn't say whether the same process used in Inyo County would be applicable here. That would depend on experiments entirely to determine. (3944.)

2183 I took samples of the purest stuff I could find from the center of the potholes, pure salt.

Q. And did those samples, the analysis of those samples, show that you could make a commercial soda ash or other commercial product by mechanical means applied to that product?

A. They all contain certain amounts of other salts.

Q. Was there any of it you found there, even the most pure, that didn't require a chemical process applied to it in order to make it marketable?

A. To make soda ash, do you mean?

Q. Yes; soda ash.

A. Every bit of it, yes.

These plants are located relatively close to Los Angeles. (3945.)

Comr. McMANAMY. Are they east of Indio station?

A. Yes; from Los Angeles to Bartlet is right on the shores of Inyo Lake (sic), where one company is, and the other is located on the east side, which is further. I should say offhand, about 240 miles.

J. H. MULCHAY was thereupon produced as a witness on behalf of defendants and, having been first duly sworn, testified as follows:

Direct examination:

I am assistant freight traffic manager of the Southern Pacific Company lines, in charge of the territory north of the California-Oregon State line, with headquarters at Portland. I have been connected with the Southern Pacific since 1909. With the exception
2184 of the period from 1915 to 1922 I was located in Portland with the Southern Pacific; the only intervening time when I was on detached duty during the war with the Western Freight Traffic Committee at Chicago, under the Federal administration.

Prior to that time, that is, prior to 1909, I was connected (3946) with the Oregon Railway & Navigation Company, going back to

just prior to the beginning of the Harriman merger, in 1901. In all that time my experience has been in freight traffic.

Q. Well, you are the responsible officer on the ground for the traffic of the Southern Pacific lines in Oregon?

A. Freight traffic, yes, sir.

Q. What territory does the Southern Pacific Company undertake to serve in the State of Oregon? I show you Exhibit 100, if it will be any help to you.

A. Well, the Southern Pacific is essentially a western Oregon institution. It aims to serve western Oregon and that part of the territory east of the Cascades immediately adjacent to its Cascade line, commonly known as the Klamath Basin, and territory south of the California-Oregon State line to the Central Pacific in California and Nevada, and also Lakeview. At least, those are the plans as I have always understood, of the Southern Pacific. They have never to my knowledge considered serving any other part of Oregon.

Q. And by "any other part" you include the so-called central Oregon territory that has been so much discussed in this case, involving the high desert and the adjoining territory?

A. Yes; I have reference to that territory east of Portland and east of the Cascades, except that mentioned.

Q. What do the brown lines on that map show there, Mr. Mulchay, while it is before you, then I won't have to bring it back (3947) again—and tell us in a general way what those small independent lines are, and what they amount to?

2185 A. Well, they represent short lines, independent short lines, that have been built by private parties in western Oregon mainly to serve timber owned by private parties largely; in some cases they are common carriers, but generally logging roads in the nature of plant facilities. (3948.)

I have prepared some exhibits for this case. The first is a statement consisting of 5 pages, showing comparison of distances via various routes from representative shipping points in western Oregon located on the Southern Pacific up to Portland, to Crescent Lake, to Granger, and to Ogden.

The title page of the exhibit generally explains its basis. It also shows the general average miles from the representative shipping points in each county of western Oregon, including Klamath County.

(The statement, consisting of 5 pages, was thereupon received in evidence, marked "Defendants' Exhibit No. 109, Witness Mulchay.")

I have another statement consisting of 3 pages, which is rather a composite showing of the distances appearing on Exhibit No. 109, to Granger, Wyoming. It shows the average distance from each county via the various routes through (3949) Ontario—through Crescent, through Roseville, through Alturas, through Portland, and the extent to which the route via Portland or via Crescent is shorter or longer than the routes via Roseville or Alturas, and vice versa.

(The statement, consisting of 3 pages, was thereupon received in evidence, marked "Defendants' Exhibit No. 110, Witness Mulchay.")

Exam. ROGERS. What did you take for each of these counties, some representative point, Mr. Mulchay?

A. Yes; the points as named on Exhibit 109. For instance, in Tillamook County you will see, on page 2, we took the stations of Wheeler, Garibaldi, Bay City, and Tillamook.

2186 Q. (By Mr. DEY.) Did you take the average of those four points?

A. I took the average of those four points. They are the principal shipping points in Tillamook County. We did not confine ourselves in the preparation of these existing tables to points shipping lumber alone, but, to the contrary, used lumber shipping points along with those at which were located canning plants, dried fruit packing plants, grain warehouses, etc. We attempted to arrive at the principal shipping points according to the general situation. (3950.)

I have prepared another exhibit, which is similar in every respect to Exhibit 110, except that it shows the average distances to Ogden, Utah, while Exhibit 110 shows the average distances to Granger, Wyoming, and the long and short mileage.

(The statement, consisting of 3 pages, was thereupon received in evidence, marked "Defendants' Exhibit No. 111, Witness Mulchay.")

I have prepared another exhibit consisting of three pages, one of which is a map attached to the last page, showing the Portland division of the Southern Pacific, with the different 16 counties, including Klamath County, colored to the groups, explanation of which appears on the map in the upper lefthand corner.

The distance table, page 2, indicates the average mileage by groups of counties to Portland, to Crescent, to Granger, and to Ogden via the various routes, that is through Portland, the proposed route through Crescent, the present route (3951) through Roseville, and the Alturas route.

These groups and distances correspond with the coloring on the map; as, for illustration, Group 1 on page 2 of the distance
2187 table, covers all of the counties in pink colored, north of the south boundary line of Marion and Polk Counties; the rest is self-explanatory.

(Said document, consisting of 2 sheets and a map, was thereupon received in evidence, marked "Defendants' Exhibit No. 112, Witness Mulchay.")

Before leaving this exhibit I would like to point out, at Salem, Oregon, the capital of the State, 52 miles south of Portland, the general average mileage from all of these shipping points in the counties mentioned is 54 miles, and which is practically the dividing line of the distance as between Salem to Granger via Portland or via Crescent.

Q. When you say Crescent, you mean the cross-State line?

A. The cross-State line. The actual distance from principal shipping point in Polk County is 13 miles shorter via the the cross-State line, but, as will be noted by the map, the traffic all comes in towards Salem, and if you take the general average you find that Polk County falls within a shorter (3952) route through Portland.

In connection with all of these tables I have used the shortest line of mileage, and if I used a mileage through which some of the traffic moves, or via which it moves, a materially different showing would be made. In other words, take Tillamook County business, for instance, where the mileage is figured via Hillsboro and the west side lines south through Corvallis, the traffic is hauled in to our Brooklyn yards and placed in trains at that point, adding some 20 miles, or it would add some 20 miles to the distance which we have used. In other words, we have used 91 miles from Tillamook to Hillsboro, where if we used Brooklyn as the base we would have a distance of practically 121 miles.

This explanation is made for the reason that in taking aver-
2188 age mileages, by taking the shorter mileage I have really reduced the distance in favor of the Portland route, where if I had used the longer mileage I would be down at Albany as the middle point.

Q. Now are those all the exhibits you have on distance?

A. No; I have another one. This is an exhibit containing 8 pages, (3953.)

The WITNESS. This exhibit explains, on the title page, generally what it is, but it shows the general average distance from the 16 counties of western Oregon, including Klamath County, by groups to Denver, Omaha, and other eastern points via various routes over which through rates are today in effect.

It indicates the extent to which the route via Crescent is shorter or longer than the route via Portland, via Roseville or Alturas; the extent to which the routes via Portland, the S. P. & S., the Northern Pacific, and the Great Northern are; also the route via Ogden and the Denver & Rio Grande; and depicts very clearly, in my judgment, the circuitous or short and long line mileage over which through rates are now in effect.

My thought in preparing this exhibit was not only to give the commission a picture of the situation, but, if the theory of this case, as I understand it, is that traffic of western Oregon to eastern points be arbitrarily routed over short line, it will be necessary to cancel all through rate existing via these various routes, because in no other way could the business be moved over the short line unless you would force the shippers or deny the shippers their right to route their traffic. (3954.)

I have shown all the gateways and the mileages on this exhibit.

(The statement, consisting of 8 sheets, was thereupon received in evidence, marked "Defendants' Exhibit No. 113, Witness Mulchay.")

2189 Q. (By Mr. DEY.) And the other one, do you want to make any comment there about reference heretofore in the previous case and this case with respect to Eugene, Oregon, having been taken as sort of a pivotal point?

A. Oh, yes; I overlooked that. Throughout this hearing, also the former hearing, Eugene has been taken as the pivotal point, and the discussion as to mileages has been from the standpoint of Eugene, and these exhibits were prepared for the additional purpose of indicating to what extent Eugene is not the representative point. Further, it shows—and this is all analyzed—that the average mileage to Portland from all of these representative shipping points is 126 miles—124 miles by water grade level line from Eugene as against 95-mile average haul from Eugene to Crescent over the Cascade Mountains, rising 4,800 feet. The mileage tables show the (3955) situation so far as the Portland route as compared with the Southern Pacific haul to Crescent is concerned, that the Portland route in every respect has the advantage to-day.

Exam. ROGERS. Mr. Mulchay, you have been in a lot of these rate cases. In the establishment of routes, what is your opinion as to whether, judging by the previous cases, the Alturas route through Granger to the East can be said to be an unreasonably long route as compared with the cross-State line?

A. No; it can not, because in these various rate cases it depends on what the parties are seeking. They compare short line rates with long line rates, and they demand rates over the shortest line be made applicable over the longest line. And that situation is best explained by taking the rates on lumber from western Oregon territory to the East via the Northern lines, via the Ogden gateway, via the Portland gateway. In 1916, you will find where the Interstate Commerce Commission ordered, and I think properly so, the 2190 same rates on lumber from Willamette Valley territory via Portland in connection with the Northern Pacific, the Great Northern, the Milwaukee, through Portland, and yet, by referring to this table, you will find that the distances to Colorado and many other eastern points are materially longer than the route via Portland in connection with the Union Pacific, and are, in some instances, longer than the Southern Pacific Roseville route. And when the Alturas route operations commence the Alturas (3956) route will have materially shorter distances than over the northern routes.

Yes; in some instances the disparity between the Union Pacific route through Portland and the northern lines is greater than the disparity between the Alturas route and the cross-State line.

The commission opened up those gateways at the request of the Willamette Valley Lumbermen's Association. I think properly so, yes. Traffic can not be covered by distances, in my experience, alone.

My next exhibit is a statement of 8 pages and represents the carload traffic forwarded eastbound and received westbound at points on the Southern Pacific lines in Oregon, including the Klamath Falls

branch, during a period of six months, using each alternate month, commencing with January, the year 1926, and arriving at estimated annual movement by the multiple of two.

The statement is prepared from the same figures that Mr. Wiggin's exhibit of traffic movements was prepared; that is, a statement prepared by our auditor, at the request of the (3957) Oregon Public Service Commission, and I have simply taken—the same figures as Mr. Wiggin's Exhibit 26 and shown them by counties to eastern territory that would be served by cross-State line according to classification of commodities as used in the annual reports to the Interstate Commerce Commission.

On the last page is a grand total of all the traffic.

2191 I may add that it has been checked against Mr. Wiggins' exhibit, and there is no material difference. It is substantially the same. There are some situations, I believe, however, should be called to the commission's attention. For instance, the exhibit does not cover all traffic moving to and from short line carriers, such as the Portland Electric Power Company, the Willamette Valley Southern Railway, whose lines are mentioned on the title page; this for the reason that (3958) those lines have joint through rates in connection with the Union Pacific through Portland, with the S. P. & S., with the Northern Pacific and the Great Northern; hence the business is divided more or less. But this statement includes any traffic that we received to or from that line and moved over the Southern Pacific.

Further, the exhibit does not represent the interchange with any particular line, but it will be noted it shows the cars moving via Portland that are interchanged with all carriers going to the territory that might be served via a cross-State line; likewise the interchange at Ogden includes the business delivered to the Union Pacific, as well as the Denver & Rio Grande. Deliveries at other junctions represent El Paso, Deming, Bakersfield, California junction with the Santa Fe, and other railroads where through rates are in effect.

I have not included in this exhibit any traffic destines to or received from points in the States of Montana, North and South Dakota or Minnesota; this for the reason that there is not only very little traffic that can move to Minnesota via Council Bluffs, but in the second place the general rate situation is such that that traffic would not be available to the cross-State line because the (3959) rates are only applicable through Portland. Mr. Wiggins shows figures from Clatsop County, and Clatsop County is not served by the Southern Pacific. Clatsop County is down at

2192 the mouth of the Columbia River, and is served by the Spokane, Portland & Seattle Railway.

I did not use tonnage for the reason that the auditor's statement was based on billed weights, and the statement was called for within a certain specified time, was gotten out as hurriedly as possible.

The use of tonnage represents a (3960) higher average than would be the case where the cars were reweighed and the actual weights obtained.

For instance, the general average weight of lumber, fir lumber, hemlock, and spruce from western Oregon to the East, is 31½ tons, according to our records based on 1927 shipments, while I believe 35 tons has been used as the average.

The weight is getting less on lumber products on the average all the time. The general average some four years ago was found on our line to have been 33 tons. It is growing less because they are ordering less material per car, and besides the drying of it, kiln drying, etc.

183,478 cars were loaded on the Southern Pacific lines alone in 1926. This includes interstate and intrastate business. (3961.) The cars were divided as follows: Forest products 151,876 cars; or 82.7 per cent of the total; agricultural products 11,555 cars, or 6.3 per cent; animal and animal products 3,644 cars, or 2 per cent; miscellaneous and manufactured, 12,096 cars, or 6.6 per cent. The products of mines were 4,346 cars, or 2.4 per cent. This latter represents gravel, rock—highway building.

Of the total cars loaded 150,180 moved to strictly local points, or points reached by the Southern Pacific and local connections in Oregon, California, Nevada, Arizona, New Mexico, and Mexico; and to Washington, Montana, North and South Dakota, Minnesota, and western Canada. That represented 82 per cent of the total. (3962.)

Q. Well, those territories you have given there, we haven't
2193 local connections that reach those. Those last territories are not reached by the Southern Pacific or local connections? (3962.)

A. Well, what I mean is, reached by the Southern Pacific through other carriers serving the territory where it would not be tributary in any respect to the cross-State line—where the cross-State line could not be used.

(The statement, consisting of 8 pages, was thereupon received in evidence, marked "Defendants' Exhibit No. 114, Witness Mulchay.")

M. C. Woodard, was thereupon produced as a witness, on behalf of defendants, and having been duly sworn, testified as follows: (3963.)

I reside at Silverton, Oregon. I am a lumberman. I have a mill at Silverton, Oregon, Marion County, 15 miles east of Salem, on the branch line running from Woodburn to Springfield. The name of this company is Silver Falls Timber Company, and I am its president. The capacity of the mill is 100,000,000.

I am president and manager of the Western Lumber Company, which mill is located at Westfir, in Lane County, about 3 miles north and west of Oakridge.

I am president, also, of the Westport Lumber Company, a tidewater mill.

2194 I am president of all three of these companies. The Western Lumber Company's mill at Oakridge is on the Natron cut-off, and on the North Fork of the Willamette. It operates in the Cascade Government Forest. The Westport plant is located in Clatsop County, about 26 miles east of Astoria on the Columbia River—what is the Westport Slough, which is about a quarter of a mile from the main Columbia River. We have deep water there. The Spokane, Portland & Seattle Railroad serves that mill. (3965.)

The capacity of the Western Lumber Company's mill on the Natron cut-off is 50,000,000 a year; of the Westport mill 130,000,000. These mills cut fir, with a small percentage of hemlock, probably ten per cent of hemlock.

I have been in the lumber business since 1893, but not all of that time in Oregon. I came to Oregon about 20 years ago; prior to that time I was in the lumber business in Minnesota.

In making shipments from our Westport mill down the Columbia River in Clatsop County we use the Great Northern and the Northern Pacific, mostly the Great Northern on our eastern shipments. We choose to route it that way on account of a sort of friendly relation I have with one of the traffic officers of that road. (3966.) Those two roads own the S. P. & S., which serves our plant. 92 per cent of our Westport cut moves out by water, 8 per cent by rail. With our other two mills it, of course, all moves by rail. From Silverton we ship some into Portland for export; but not from Westfir. I would say about, oh, not to exceed 10,000,000 a year comes into Portland for export, that is, coastwise and export. That varies more or less.

2195 As to what territories our products move from these mills for consumption, the Silverton plant I would say moves about 15 per cent into (3967) we call the Oregon territory, which is practically Portland. That is door lumber, export, or coastwise, and, oh, a low grade of lumber that we ship into some of the retail yards in Portland. The balance of our lumber at Silverton all moves on a—I say "all"; 90 per cent of it moves on a 70 or a 47½-cent rate or better. We do that because we want the long haul, or the long freight rate. The business from Silverton into California is very small. The Westfir plant moves 75 per cent of its lumber into California. And the 25 per cent goes east and local into Klamath Falls.

We route our own shipments. We do not do any routing in conformance with the wishes of our customers; we pay no attention to their routing. As to the route we use on the shipments from Westfir and Silverton that go east, all lumber going into Minnesota territory, or what we call the northern territory, Minnesota and North Dakota, and over into northern Michigan, goes over the northern lines, and the balance of it all goes through the Ogden gateway. What goes to the northern lines comes to the Portland gateway (3968) and is delivered to them there. The balance moves over the Southern Pacific through Ogden. We follow that routing on

that vast quantity of material because we find that that routing is just as good as the northern routing. I say just as good; perhaps there is a day or two longer. Sometimes we get shipments through on the southern routing just as quick as we do on the northern. Our average shipments into Chicago will run right around 12 to 13 days. Our practice is to give the long haul to the carrier that serves the mill.

2196 I am not very familiar with the proposed cross-State line that has been talked of in the newspapers. I just know about it, that is all. Assuming that it is an accomplished fact and built, and is 215 miles or so shorter than the shortest route that the Southern Pacific would have available for us, I don't think there would be an incentive in that for us to change our past practice. (3969.) I am a member of the Willamette Valley Lumbermen's Association.

Cross examination:

None of our mills are served by the Oregon Electric. I can't tell you the number of cars we shipped east in 1927 from our Silverton mill and our Westfir mill. We shipped right around 3,700 cars of lumber and lath out of Silverton, altogether, in 1927. That figure includes all of our lath and lumber shipments. I would say that as many as 2,000 of those go east. As to how many cars altogether we shipped from the Westfir mill in 1927, I haven't that figure and I don't know that I have ever seen it, but our cut at Westfir last year was about 40,000,000 and there was practically no lumber used at Westfir, so that if you divided 40,000,000 by about, (3970) say 24,000, you would get the number of cars that moved out of Westfir. I would say that that would make somewhere around 1,600 cars. And I said about 75 per cent of the Westfir production went to California—we serve the California trade by using the Westfir plant. I would say that the number of cars that may have gone east last year from Westfir would be somewhere around 200.

Q. Now on your business to the East, constituting last year perhaps 2,200 cars as a minimum, have you been solicited, and
2197 are you being solicited, by the Union Pacific to route some of that traffic via Portland and the Union Pacific lines east?

A. Oh, I presume that we are. I don't know that we are, though.

Q. You don't know that you ever have been? (3971.)

A. We are solicited for freight by the Union Pacific; yes.

On our bills of lading covering shipments that we send east at the present time from Westfir and from Silverton, we merely say "Southern Pacific and Union Pacific, Ogden"—we specify the originating line and the gateway Ogden.

I have heard of the construction of the so-called Alturas line of the Southern Pacific Company from Klamath Falls to Alturas.

Q. There has been testimony in this case, Mr. Woodward, that that new line will be completed about the middle of next year and put in operation. That will cut off the distance to eastern destina-

tions on traffic that now moves through Ogden and that will move then through Ogden a little over 200 miles. Do you consider that the construction and operation of the Alturas line of the Southern Pacific will be of benefit to your mills at Silverton and at Westfir?

A. Why, I presume it will shorten our time east somewhat. I don't know as to that.

Q. It will shorten the distance east something like 215 miles (3972) and will make a saving in time in transit, as estimated by other witnesses, of about a day; that is, about 24 hours in time. Do you believe that the use of that line, after it is constructed, will be of benefit to your two mills at Silverton and Westfir, on your eastern shipments, as compared with the Roseville route, 215 miles longer than that?

A. Well, I don't think a day's extra time would mean very much to us.

2198 Q. Do you believe that the construction and use of the Alturas line when built will be of any benefit at all to your Westfir mill?

A. Why, it naturally will quicken our eastern shipments, but I don't know that it will be of any particular benefit to us.

Q. Well, from your standpoint as a lumberman, having mills at Silverton and Westfir, would you be equally well satisfied with the rail service you have now, if the Alturas line never were built?

A. We are just perfectly satisfied with the service that we are getting at the present time.

Q. Well, then, will the building and the operation of the Alturas line be of any benefit at all to your Silverton mill (3973) and your Westfir mill, in your opinion?

A. Why, naturally, it will be of some benefit to us; sure. As to why it will be of any benefit to us, the day's extra time that it took will probably help our customers out to some extent, get our lumber east quicker, but it would not bring us any more business or give us any increase in price for our lumber.

Q. Do you find that your customers are interested in getting speedy delivery of their orders, quick delivery of their orders?

A. Well, about thirty days. Our companies get from eastern purchasers a good many orders that call for immediate shipment. But if our companies were not in a position to ship an order as quickly as some competing mill in western Oregon might do, I don't think it would have any effect on our ability to obtain business from eastern customers.

2199 Q. In recent years have the eastern buyers of fir lumber, as your experience has gone, been expecting and demanding quicker delivery than they did formerly?

A. Yes. I think all lumber is moving faster than it ever has moved—than it moved five or six years ago.

Q. Haven't the eastern buyers of lumber come to expect and (3974) demand prompt delivery of their lumber?

A. They expect a shipment out of the mill at any time inside of thirty days. That is prompt shipment, from 20 to 30 days. For instance, if we receive an order today and get it out in 20 days from from now, that is prompt shipment; that is getting it away from the mill. (3975.)

Q. Yes. Mr. Woodard, as a lumberman, do you see any benefit whatever in competitive rail service in having a lumber mill served by more than one line of railroad?

A. We haven't found it so. We have three mills on one line of rail.

Q. Other things being equal, would you rather have two railroads, or only one, serving the sawmill that you owned and operated?

A. Why, I think I would be just as content with one as I would be with two.

Q. Do you know whether your view in that respect is shared by lumbermen generally?

A. No; I do not.

Q. How do you account, if it were, for the concentration of big lumber operations at such points as Portland, Seattle, Tacoma, Spokane, Bend, all of which are served by two or more lines of railroad?

2200 A. Well, I think as far as Portland is concerned it is the water transportation, and the fact that the river—you can get logs on the river almost anywhere up and down; you have a hundred miles of river; something to tow your logs on. Your housing of your crew—naturally if you have a city which you can house your crew in, why, you have a better chance of getting a crew and maintaining a crew. I don't think the shipment of lumber is taken into consideration at all in locating a sawmill. (3976.) It is where your lumber is and what your facilities are for operating at the place that you manufacture.

Q. Well, now, take Astoria, isn't Astoria located at a point on tidewater convenient for water shipment?

A. Yes, sir.

Q. Isn't Astoria very close to enormous supplies of stumpage?

A. Not now; no.

Q. Well, isn't Astoria in a position where it can get any required amount of logs dumped into the Columbia River and towed? Isn't it advantageously located from the standpoint of log supply? Getting log supply?

A. Not at the present time; no, I don't think so.

Q. How do you account for the fact that there is not such a concentration of lumber manufacturing at Astoria, which is located on one line of railroad and on tidewater, as there is at Portland, or at Seattle, or Tacoma, or Grays Harbor in Washington?

A. Well, I presume that was because of the early location of the sawmills. You take the sawmills here in Portland, they are older mills, and I presume they are located here because of convenience of crew and convenient shipping point, water and rail.

2201 I know that over on Grays Harbor, at Aberdeen and Hoquiam, Washington, there are extensive lumber milling interests. (3977.) They have tidewater so they can ship by water, and they do it by water extensively. And they also have competitive rail service. I don't think the competitive rail service at Grays Harbor has anything to do with the comparative development of the lumber industry at Grays Harbor as compared with Astoria. I think I would make the same statement with respect to the development of the lumber manufacturing at other tidewater points, Seattle, Tacoma, and Portland, as compared with Astoria.

Redirect examination:

In respect to Astoria, it is a fact that the Hammond Lumber Company had a very large plant there for many years and it burned down there two or three years ago. It is also a fact that practically all the fir lumber around Astoria has been cut off. (3978.) I think the Hammond mill—I got here twenty years ago, and they were operating then, and I think I was out here three or four years before, probably 25 years ago—and they were operating at that time. As to whether Astoria had rail service of any kind until the Astoria and Columbia River Railroad was built along in the "nineties," I don't know when it was built. I do know that it was built by Hammond, the same man who had the sawmill down there.

We do not have any question raised by any of our customers asking if we can route our shipments so that they will reach them a day or two earlier, excepting that we do have requests to trace shipments—we do that anyway; we always trace our shipments, follow them right through, but those are few and far between.

2202 I don't think we may look forward out here to any immediate substantial increase in the production of fir lumber. (3979.)

None of our mills run to capacity. Our Silverton plant hasn't run to capacity, of, for seven or eight years. I think there will be a decrease in the production of fir lumber rather than an increase in the next five years over the 1927 figures. Respecting the testimony in this case that while there is now being shipped out of western Oregon a little more than 20,000 cars through the Ogden gateway, with the cross-State line built there will be 60,000 cars of fir lumber available for shipment that way out of western Oregon. I don't know where it would come from, or rather I don't know where it would go.

Recross-examination:

The Hammond mill at Astoria was not rebuilt after it burned down. (3980.)

Q. The timber has all been cut-off that originally was close around Portland, hasn't it?

A. Well, I think there is more timber close to Portland than there is to Astoria.

Q. Do you think the Portland mills are more advantageously situated to get logs than mills at Astoria would be?

A. Right at the present time, yes. The whole Columbia River is pretty well cut up, up to the confluence with the Willamette.

In answering a question of Mr. Dey's I did not know that in the year 1927 there were loaded on the lines of the Southern Pacific, in Oregon, 151,875 cars of forest products. (3981.)

2203 J. H. MULCHAY thereupon resumed the witness stand and testified further as follows:

Direct examination—Contd.

As to the 151,876 cars of forest products that Mr. McCulloch just mentioned in his cross-examination of Mr. Woodard, it includes all forms of forest products, with the exception of the highly manufactured articles such as doors—wood, sawdust, pulpwood, logs and lumber. Slabwood, cordwood, all species of forest products.

I believe I stated that there was 150,180 cars moved from what is territory not tributary to the cross-State line. This leaves 33,288 cars, as shown on the last page of the Exhibit 114, that I have credited to the cross-State line. Of this eastern movement, 27,148 cars, or approximately 83 per cent, consists of forest products; the (3982) balance, 4,398 cars consists of agricultural products.

The eastbound movement of this traffic is divided, via Portland, 5,926 cars, or 18 per cent; via Ogden, 25,712 cars, or 77 per cent; via other junctions, principally through El Paso, Deming, New Mexico, Bakerfield, California, 1,650 cars, or 5 per cent.

On the same page of the exhibit it will be noted that there was 3,664 cars of westbound traffic allocated to the cross-State line. The movement of this westbound traffic was 2,016 cars, or 55 per cent; via Ogden, 1,226 cars, 34 per cent; via other junctions, principally through El Paso, et cetera, 422 cars, or 11 per cent.

We go after the westbound business, and the business that we secure westbound, the majority of it, the consignees in this ter-
2204 ritory favor us with the routing on it, or routing instructions favorable to our Ogden route, but the eastern lines, that is, the lines originating the traffic, for instance, the Union Pacific, or the Northern Pacific, the Great Northern, they are striving the same as we are for their longest haul, hence the movement via Portland westbound naturally goes in greater proportion, via Portland, because of that fact. (3983.) There are more of them that come in here to Portland who go after the westbound business; and there is another element. For instance, while we have agencies in the East that are active in solicitation, you take the Northern lines, for instance, and the Union Pacific, their rails actually touch many of the points where the business originates—for instance, you take the Burlington, working closely with the Northern Pacific and the Great Northern, they serve all of the Mississippi Valley, have their own rails into Chicago, Kansas City, St. Louis—any traffic that we might have to secure in competition with them must be solicited through other lines and out here with the consignees. Naturally, a shipment

originating on Burlington tracks, they have the greater opportunity to move it via Billings and Minnesota Transfer in connection with the Northern lines. This covers the business moving via all lines through Portland. That is all the westbound transcontinental business we get. Through Ogden there are 1,226 cars a year.

We do not participate in a great deal of the Portland traffic. (3984.)

Of the total eastbound movement of 33,280 cars, 81 per cent, as I stated, consists of forest products, showing that outside
2205 of forest products there is very little other tonnage moves eastbound to support the Southern Pacific or any other railroad. We are more dependent than ever upon the long haul of forest products, because the Panama Canal is taking the other traffic, and this business is badly needed to support existing lines.

Reverting to the exhibit, page eight, and also with reference to Exhibit 112, and refer to the map, the last page, take the territory colored in pink, being the counties of Polk, Marion, et cetera—of the total traffic that we originated during the year 1926, 88,576 cars, or 48 per cent, originated at points within that territory. Now, of the movement to eastern territory, 14,516 cars moved from those counties via all routes, or 44 per cent of the total eastbound traffic.

As I stated earlier, if distance is to control, the short-line mileage is via Portland, and none of the traffic, under such theory, would be tributary to the cross-State line. Further, there is colored in yellow the counties of Josephine and Jackson. The distance via Roseville at the present time on an average basis is but 42 miles greater than (3985) would be the route through Crescent. This traffic, for a difference of 42 miles, considering the fact that the Roseville route is the line of least resistance, even though a few miles longer, I don't believe that any of it—and it is principally fruit, pears and apples—would move via the cross-State line.

I say the Roseville route is the line of least resistance because the service rendered south in the case of fruit is such that we have 10 cars out of the Rogue River Valley, or we have 20 cars, or 5 cars, it reaches Roseville, goes into the solid fruit trains, moving to the
East every day, 2 or 3 of them, every day of the year, where
2206 if the business moved via Portland or moved via the cross-State line there isn't the opportunity to move it in the same fast—or give it the same fast service. I refer to service and not the physical characteristics.

Jackson and Josephine Counties are only 42 miles difference around the Roseville route, on the average, than by the cross-State route. I have got it checked out here. (3986.)

This statement can be analyzed almost any way you wish. It is made up in such way that it shows all the business from each county, and with those observations I think we can pass on.

As to the Alturas line, I did considerable work in connection with the preparation of the application that was made to the commission

for the construction of that line. As to the purposes that that line will serve, there are several of them—I would say three permanent—the first being that it enables a material saving in the cost of handling through traffic; it will also assist us in securing considerable new business in the Portland district and other western Oregon territory that we serve, both east and west bound. Second, it will develop new business; and, third, it will perpetuate the Nevada-California-Oregon Railway, which it seems the Interstate Commerce Commission considered should be maintained, because they declined to approve an application for abandonment several (3987) years ago, well, in fact, they required the Southern Pacific to increase divisions, division allowance, to the N.-C.-O. 10 per cent to assist in maintaining it. The line also will tap a large acreage of farming lands, reclaimed lake beds in the Tule Lake Valley. However, this traffic is small and would not warrant the construction of the Alturas line in and of itself. The line can only be sustained largely by
2207 the through business, but with the through business, with such local business as can be picked up and increased business expected from the N.-C.-O. Railway, that the line is justified.

The western Oregon business which I said was relied upon in the construction of this line, and the operating saving in the handling of that business under the Roseville route, is exactly the same business that has been described here and that is relied upon to support the cross-State line. There has been a changed condition come in, however, and that is the Great Northern are now at Klamath Falls, and is a strong competitor for the business that has heretofore moved over the Southern Pacific lines to and from that territory. While, of course, we expect to maintain, continue, and enjoy a large tonnage, there is no reason why the Great Northern (3988) can not be relied upon to materially reduce our taking; therefore, the Alturas line will be more and more dependent upon western Oregon for tonnage.

The case I referred to when I mentioned about the Nevada-Oregon being perpetuated was Finance Docket 1796, reported in 72 I. C. C. 433, dealing with the application for the abandonment of the line, and the division case, being I. C. C. Docket 13549, reported in 73 I. C. C. 330. I have some comment here, but it is unnecessary, as you state; they speak for themselves.

I have given some consideration to Mr. Teutsch's exhibit—Exhibit 1 in this case. The item of canned goods—Mr. Teutsch in his exhibit states that there are 254 cars available at the present time in the counties of Linn, Benton, Lane, Douglas, Coos, and (3989) Curry. He also estimates that within five years there will be 155 addi-
2208 tional cars, including 28 cars from Jackson County, making a grand total with five years, including the present, of 409 cars. The total cars of canned goods from the canneries located in the counties mentioned in the year 1927 was 498. Only 93 of this total moved to eastern territory, and it would seem clear that an estimate of 250 cars from those counties is overly optimistic, but, to carry it further, there is an increasing pack of canned goods, just as he showed

in his exhibit. However, the increased movement by rail to the East is growing less in proportion to the increased pack. For instance, in 1920, out of total of 1,279 cars loaded on our rails in Oregon, 316 cars, or 25 per cent, moved to eastern territory by rail. In 1927, of a total of 1,973 cars, 405 cars moved east by rail, or 21 per cent of the total. In other words, the pack increased from 1920 to 1927 35 per cent, or 694 cars. The eastern rail shipment, however, was only 89 more cars in 1927 than it was in 1920, and that covers all the territory in Oregon served by the Southern Pacific rails, and I might digress here for a moment to point out that I believe Mr. Norton testified in this case that he trucked canned goods from Roseburg to Portland, which is a fact. (3990.) That is 198 miles. The port of Portland reports, for the year 1920, 8,302 tons of canned goods shipped out by water, an equivalent of 276 cars of 30 tons each. In 1927 the water tonnage was 59,027 cars, or 1,967 cars on the same basis.

Q. An increase of about 800 or 900 per cent. (3991.)

A. Well, I didn't figure it out—yes. I would like to analyze this canned-goods situation further, because there has been a great
2209 deal made of it. Of the total pack in 1927, 1,750 cars originated at canneries in the Willamette Valley, Cottage Grove, and north. This represented 90 per cent of the total cars loaded. On a weighted basis, taking the number of cars from each cannery, applying the actual mileage thereto, or weighing them, the average haul to Crescent would be 172 miles as against the average haul to Portland of 48.2 miles. In other words, on a weighted average mileage basis, and which is used very frequently in rate cases, all of the canned-goods tonnage should move to Portland. I would like to carry this a little further and point out that of the total cars that were packed or shipped 1,400 originated at canneries Salem and north. In other words, over 70 per cent of the total cars shipped originated within 52 miles of Portland, and these canneries shipped 298 cars east of the 405 from all of the territory. In other words, 73½ per cent of the toal, under those circumstances, that was carried all the way through there, was not available tonnage for eastern rail shipment in the canned goods business.

As to a consolidation tariff restricting the movement of canned goods (3992), I believe Mr. Lounsbury mentioned canned-goods tariff that we have for consolidation—a special tariff on canned goods for consolidation. We make reduced rates on canned goods for consolidation purposes. If one cannery is producing canned berries and cherries and they desire to consolidate some with a cannery that is putting up pears and apples, we make them low rates for that purpose. This tariff does not restrict the routing to the Southern Pacific, so far as gateways are concerned, but the rates are applied on canned goods whether the business is moved out via
Portland or any other gateway. I simply want to correct the
2210 impression that the tariff is an arrangement designed to force the business to the Southern Pacific long haul.

I have been operating in this territory a long time. It is not within the realm of possibility that any such quantity of canned goods will be available as Mr. Teutsch predicts. Not for eastern shipment. (3993.)

The situation with respect to dried fruit is quite similar, only more pronounced than in the case of canned goods. Mr. Teutsch states there are 156 carloads of dried prunes available in the counties of Linn, Benton, Lane, and Douglas, and that there would be an additional tonnage available within a period of five years 22 cars. Now the tonnage is available; there is no question about the tonnage being in existence. It exists. However, this traffic moves out by water. In the year 1920 out of a total carloading of 330 cars, 210 cars moved to eastern points via rail, or 64 per cent. In 1927, 640 cars were loaded in all the territory. 136 cars only moved to eastern points, or 21.3 per cent. In other words, while in 8 years the number of carloads for shipment increased 100 per cent, the percentage that moved by rail decreased 200 per cent.

Now the port of Portland reports show in 1923, 11,809 tons, equivalent to 394 cars, by water. In 1927, 31,197 tons, equivalent to 1,039 cars. I have the figures covering all the intervening years here, but it carries out the same identical comparison, that (3994) the dried fruit tonnage is moving more and more by water. And in the last year one of the largest packing plants, the largest packers of dried fruit, moved their plant from the Roseburg district, from Polk County, Dallas, to Portland, and much of the dried fruit is
2211 coming in here to be packed in that plant so it will be on tidewater.

Broccoli: I want to read its shipments into the record since the year 1920.

Total cars loaded, 1920, 25 cars, eastern movement 20 cars.
In 1921, 55 cars, 51 cars eastern movement.
In 1922, 105 cars, 87 cars eastern movement.
In 1923, 249 cars, 217 cars eastern movement.
In 1924, 330 cars, 277 cars eastern movement.
In 1925, 58 cars, 47 cars eastern movement.
In 1926, 958 cars, 817 cars eastern movement.
In 1927, 297 cars loaded, 241 cars eastern movement.
In 1928, 303 cars, 175 cars eastern movement.

Mr. Teutsch's exhibit stated that there was available at the present time 419 cars of broccoli, and estimates 419 cars apparently annual proportionate increase during the next five years. He also estimated 150 cars was coming in from Coos and Curry Counties.

Broccoli and winter cauliflower is grown in many (3995) localities of the United States; in fact, there is nothing uncommon about it at all. It is a highly perishable commodity. While considered hardy, at the same time 1926 was the peak year and it is not expected any tonnage beyond 200 or 300 cars in the future. The growers are discouraged because they have had four bad years, 1926 being the

only good year that they have had. They are not going to plant. Take, for instance, 1925: The estimate from the plantings of 1925 was 1,400 cars, but a cold spell, freezing weather in December, 1924 cold rains, winds of January and February, reduced the crop, practically wiped it out. In 1927 acreage planted warranted, by conservative estimate, 1,200 cars. I would like to erase that; make
2212 that 1927 the estimated rail movement from the acreage was 450 cars. The farmers reduced their plantings materially. The actual shipment was only 330 cars. The decrease was due to high water, flooding out many of the fields, the heavy rains in February interfering with the harvest. The 1928 plantings warranted an estimate of 420 cars. 303 cars were shipped, but only 175 to eastern territory. The crop was cut down by the sudden warm spell this year, as everyone knows, causing the broccoli to mature too early. It became No. 2's, largely, and was not suitable for the eastern market in any particular quantities, and much of it was not shipped. (3996.) I do not think that even if the cross-State line were built this broccoli would move over that line in any apreciable quantity; this for the reason that much of it is sold for diversion en route, or, rather, it is sold while in transit, the same as considerable other fruit products.

Portland is the natural gateway for the fruit of western Oregon grown in the Willamette Valley or adjacent thereto. I mean fresh fruit. Much of this traffic comes in here, and diversions are placed, to be moved to Seattle, to Spokane, British Columbia, or east from here, and that is the way broccoli is handled to a large extent. (3997.)

It seems throughout this hearing there is some mystery about the reason why this broccoli moves through Portland. I would like to clear it up. There is nothing mysterious about
2213 it. One of the largest shippers of broccoli—there are three of them in the Roseburg district—came to us in 1923. He was building a packing plant, a packing house, and wanted us to put in a sidetrack to serve that house without cost to himself. We declined to do it, because if we had done it it would have been an unlawful discrimination. Now, in 1926 the big crop coming on, he thought he would penalize the Southern Pacific. Instead of sending the business by Roseville, as they had done in the past, he instructed all of his business, and notified us it would move via Portland. Well, gentlemen, this business moves over a period of about 60 days. There are a certain number of cars to be moved out every day and there is a certain amount of special service that has to be given. Now, if we had divided that business—the other shippers were perfectly willing to (3998) send their traffic as they had in the past, via Roseville, but had we divided that business and taken part of it southbound, the other northbound, we would not have been able to give the service in either direction, dislocated power, and so on. So we went to these other shippers and voluntarily—

we voluntarily went to these other shippers and told them, "Now, gentlemen, we are interested in giving you the service. Instead of specifying on your bill of lading the Ogden gateway, route it as you wish, but leave the gateway open and let us take the business via the route over which we figure we can give the service." Now, gentlemen, that is all there is to this broccoli routing via Portland. I think I did right. The business has continued to route this way, although we do handle some of it via Ogden, as the records will show. But you can't give service to broccoli, or
2214 anything else, by splitting it up into small parcels. It would be more costly to give a special service in both directions, and there is nothing that requires more service than fruits and vegetables—green fruits and vegetables. I might add that this broccoli is grown in the Umpqua Valley. There is some 20 miles between the northerly end and the southerly end of the district and the southern end of the valley where this broccoli comes in, around Riddle, Myrtle (3999) Creek, etc. It must be all gathered to a central point. When we move it one way we can handle it better than we can when we handle it in split lots and gather it together.

I have some quotations of the Chicago market on broccoli from day to day. I took the chief market days, which are Mondays, Wednesdays, and Fridays. I can read it that way, or read it consecutive in days. Tuesday, February 14th, 1927, according to reports of market prices by the United States Department of Agriculture, Bureau of Economies, Bureau of Markets: Cars on hand, 47 from central territory, central California, 16 from southern California, fancy ranging from $1.35 to $1.50 per crate; fair $1.25. February 15th, 28 cars from central California, 20 cars from southern California, 2 from Oregon; fancy, $1.25, $1.40; fair, $1.00 to $1.20. February 16th, Thursday, 41 cars on hand from California; fancy ranging from $1.25 to $1.35; fair from $1.00 to $1.20. Saturday, February 18th, 16 cars on hand from California (4,000), prices ranging from $1.25 to $1.35 for fancy; $1.00 to $1.10 for fair. (4001.)

Here is Monday, March 5th, 63 cars on hand, 5 of which from Oregon, 1 from Texas, balance from California; fancy ranging from $2.00 to $2.25; fair $1.75. March 6th, 76 cars on hand, 11 from Oregon; fancy ranging from $2.00 to $2.25, and fair $1.75. Wednesday, March 7th, 75 cars on hand, 11 from Oregon, prices
2215 ranging, central California, southern California; $2.00 to $2.15 for fancy, $1.85 to $2.00 for fair. Oregon, $2.25, new style crate; Oregon-Texas standard size crate, or old crate, $2.00, $2.15, $1.18, $2.00, the same as California. March 8th, 64 cars on hand, prices ranging the same as on Wednesday, March 7th, with the exception that the $2.25 for fancy on Oregon broccoli had dropped to $2.00.

Generally the market jumps up and down from day to day, depending upon the supply on hand and other elements.

Q. Ranging probably 25 or 50 cents a crate?

A. These figures are all available by inspection of reports of the Department of Agriculture. (4002.)

Those prices were at Chicago.

I think about 400 crates of broccoli are loaded in the ordinary car. The weight is slightly less than 20,000 pounds. The minimum is 20,000 pounds.

Seeds: Mr. Teutsch estimates 28 cars of seed in Lane, Linn, Lincoln, and Benton Counties. It is true there is considerable production of clover seed, vetch, rye grass, in western Oregon. However, this traffic, like the dried fruit and the canned goods, moves largely by water. Taking the entire territory, that is I mean all western Oregon points on the Southern Pacific, we had 142 cars in the year 1927. Of this total 76 cars moved to Portland for export by water; or exactly 50 per cent. 30 cars moved to California, 4 cars to Seattle, 32 cars to eastern territory. Now the fact is that so far as the counties mentioned by Mr. Teutsch, the eastern movement consisted of but 9 cars from the counties which he mentioned, as against his estimate of available tonnage at the present time of 28 cars. The port of Portland reports show that the intercoastal (4003)
2216 movement for the year ending November 30th, 1927, was 2,526 tons, or an equivalent of 168 cars, 15 tons each. The records of the movement of seed, its growth, etc., cannot be depended upon for any amount of tonnage in the future.

Wool: I will not take any time particularly to discuss wool, but Mr. Teutsch estimates 9 cars of wool being available for eastern movement from Klamath County. There was no movement, although the records show that in 1926 there was 9 cars out of Klamath County, 8 of which, however, moved to California, and 1 to Portland. The eastbound movement of wool from these Pacific Coast States will be entirely by water. The rates are adjusted. Besides that, Portland has become the real wool market of the Pacific northwest, and of the Pacific coast. The readjustment of rates when the carriers were denied continuation of fourth section relief, in the general wool rates investigation July 8, 1924, reported 91 I. C. C. page 235, so changed the conditions that the carriers by rail will not move the business to the East.

Celery and lettuce: 50 cars of lettuce were estimated by Mr. Teutsch from Coos and Curry Counties, and also some celery. I doubt very much, in fact my advices are from authorities at the agricultural college, and from people who have been interested in a monetary way in efforts to grow (4004) celery and broccoli, also lettuce, in the Coos Bay territory, which has been a part of some efforts we have ourselves made in the past three years, that there is something in the soil, or climatic conditions, the fog, that will not permit of its being grown in marketable quantities. The celery district of Oregon is in the Lake Labish territory, which extends east from the Oregon Electric station at Quinaby to approximately

Mt. Angel on the Wodburn-Springfield branch of the South-
2217 ern Pacific. The Southern Pacific main line crosses through the bottom or lake bed about six miles north of Salem. This celery is grown largely by Japanese. It moves part from Quinaby station on the Oregon Electric, part from Brooks station on the Southern Pacific. Both of these points, Brooks and Quinaby, are 44 miles south of Portland. In 1927 the movement from Brooks was 393 cars to eastern territory. 51 of these cars moved east via the Southern Pacific lines through Ogden, 232 cars moved east via Portland, 20 cars moved to Texas via the Southern Pacific through El Paso, 63 cars moved to California.

I am not going to quote the number of cars divided between the different carriers at Portland, but a very substantial part of the movement was turned over to the S. P. & S. Railroad and taken east via that line over the Great (4005) Northern. The reason for this is that the growth of celery first began at Quinaby, or in the vicinity of Quinaby. The Oregon Electric built a packing shed for the packers, leased it to them, and they favor that line with their shipments, that is the Oregon Electric-S. P. & S. lines with the shipment from Quinaby. Likewise they favor those lines on the business that originates with the Southern Pacific that goes east through Portland. By referring to one of these distance tables I have placed in here, you will find that the mileage is longer via the route the majority of this celery moves than it would be via Portland and the Union Pacific, the distance not making any particular difference in the routing of the traffic.

Walnuts and filberts: An estimate of 7 cars is made as available
2218 from Linn and Lane Counties at the present time; within five years 11 additional cars from Lane County. That prediction is Mr. Teutsch's. I think he is overly optimistic. So far the production of walnuts and filberts in the Willamette Valley has been largely in the Yamhill district. In any event, the total movement in the year 1927, carloads from Lane, Linn, and Yamhill Counties, was 7 cars, 5 of which originated in Yamhill, one in Linn and one in Lane. Three cars moved to Chicago, one car to Seattle, three cars (4006) to Spokane and Boise. I am satisfied it will be a good many years before we have the tonnage that he estimates from Lane County or Linn County.

I will be glad to leave out green prunes. The hop industry at one time was a very important one, involving from 1,250 to 1,600 cars per annum. The since the passage of the Volstead Act the hop industry is less than half of what it used to be. But the carriers to protect this traffic to the rail lines—about 70 per cent of it moves to England and Germany—we were obliged two years ago to establish a special export rate of $1.75, or 75 cents per 100 pounds less than the regular rate, in order to hold this traffic away from the boats. But I have on my desk at the present time advices that we are likely to lose considerable of this business this year to foreign water carriers moving through the canal.

Barreled strawberries: This is an industry that is developing, but an estimate of 87 cars from Linn County I believe is overly optimistic. In any event, the trend of this (4007) traffic is by

truck to Portland for storage in the cold storage warehouses here. I do not know what the Oregon Electric handles, but so far as the Southern Pacific is concerned we have only handled about—
2219 last year six cars and 10 cars of this season's business. This all originated at Salem. We handled no business from Linn. But the reason why I speak of the trucks is because both the Oregon Electric and ourselves were obliged to reduce the rate on barreled berries from Albany and Linn to Portland in order to hold some of this traffic to our rail lines as against the trucks. That reduction of rates was made a few months ago.

Livestock: The Southern Pacific originated during the years 1920 to '27 an average of 1,540 cars of livestock per annum. That is, when I say originated, I mean they originated it in the State of Oregon exclusive of Klamath Falls. A general average of 30 per cent moves to California, 40 per cent moves to local points, including the Portland Union stockyards. An average of 29 per cent moves to Puget Sound. The largest eastern movement of Southern Pacific stock—of stock originating on the Southern Pacific, was in 1922, when there was 38 cars of sheep forwarded from the Umpqua Valley to the East, and in 1926, when 14 cars of lambs and sheep moved from the same county. Practically all of the livestock of the Klamath district goes to California. (4008.) That is true since the Cascade line was opened, the last two years. It is continuing to go to California largely.

During Mr. Lounsbury's testimony I gathered there might be some misunderstanding as to how the Southern Pacific reached the Portland Union stockyards. On any stock originating on our rails or moved over our line we apply through rates to the yards, which rates apply joint with the Union Pacific through east Portland, or joint with the S. P. & S. through Portland, west side.
2220 Likewise stock may be shipped out of the stockyards to points or via the Southern Pacific, subject to through rates from the yards via the same lines, the Southern Pacific absorbing the switching charge, with the exception of a small arbitrary that is added to make the through rate. I make this explanation in order that there be no misunderstanding about the Southern Pacific's rails, or the methods under which they reach the yards.

An estimate of 40 cars of bulbs from Josephine County to the East: For a period of 18 months or, well, a period of 19 months, January 1st, 1927, to July 31st, 1928, there was two cars of bulbs moved from Grants Pass, one to Benton Harbor, Michigan, two to Wilson, New York. Now the 40 cars estimate is potential within five years. I hope that it reaches that magnitude, but it is questionable. (4009.) I have grave doubts of it doing it. I don't think there is a possibility of growing that quantity of bulbs in the Grants Pass district.

I prepared, to go with my explanation in connection with the corn and flour and cereals and potatoes, a statement showing the production of cereals and potatoes, according to reports of the De-

partment of Agriculture, years 1920 to 1926, that I would like to offer.

(The statement so offered and received, consisting of four pages, was thereupon marked "Defendant's Exhibit No. 115, Witness Mulchay.")

The statement is self-explanatory, but the object of it is to show that western Oregon is a heavy producer of cereals and potatoes, and, as I will show further on, export considerable tonnage.

Mr. Teutsch estimates there is now available 748 cars of feed
2221 grains and prepared feeds in eastern Idaho for movement to western counties in Oregon, Linn, and south, with a potential added movement, five years, 223 cars, or a total of 971 cars. (4010.) I have no doubt, perhaps, the cereals are grown in these quantities. In fact, I know nothing about it. But from the consuming standpoint I do not believe that Mr. Teutsch's estimate of moving the traffic to western Oregon is correct. I neglected to state there that he estimates 385 cars of corn is also ready for immediate shipment, assuming that western Oregon is to consume this amount.

Dealing with corn first, in the year 1926, total movement of corn, points on the Southern Pacific's entire line, was 479 cars, 227 of which moved to the counties north of Marion and Polk, or a territory where the distance via Portland is shorter; the counties of Linn, Benton, and Lincoln, 51 cars; the counties of Lane, Douglas and Coos, 155 cars; 46 cars to Josephine and Jackson. It would be necessary for Lane County, to carry out Mr. Teutsch's estimate, to materially increase its importations, because it imported 93 cars in the year 1926, while the estimate is some 385 cars to Lane County, or four times greater tonnage than actually moved in 1926, which was a good year. Further, it will be necessary for the States of Montana and South and North Dakota, and Nebraska and Kansas, that is the dealers in Portland and the Willamette Valley to buy corn in those territories, to go entirely out of the western Oregon business. (4011.)

Feed and grains: Southern Pacific receipts, 1926, flour and feed, in western Oregon, is 588 cars. The estimate of 748 cars for east-
ern Idaho to western Oregon counties is certainly too high,
2222 as I doubt that they are prepared to consume that much at this time. At any rate, the estimate was made for Linn and south. Linn County, Benton, Lincoln, all territories south, including Klamath County, consumed of flour and feed in 1926 277 cars. Now, there is a large exportation of grain from western Oregon to Portland. There were 437 cars loaded on our lines of oats in 1926, and 536 cars of wheat. In addition to this, the flour mills and grain dealers of Portland tell me there were approximately 17,500 tons of wheat and oats moved into Portland last year by auto truck, which is equivalent to 450 cars. Now, with all the production that there is in western Oregon, the opportunity to compete, I have grave doubts of western Idaho and southern Idaho shipping into

this territory any appreciable quantity, although there is considerable flour and grains milled in transit at Portland, moved down the valley, but it would continue to move via Portland.

Hay: The estimate calls for 116 cars of hay in Lincoln County. That is Mr. Teutsch's estimate. During the year 1927, Lincoln County imported 42 cars of hay from all sources. In other words, the estimate is for almost three (4012) times more than what was consumed in 1927. 1927 shows a decrease of 10 cars over the movement in 1926.

Lane County: The estimate indicates 40 cars of alfalfa hay for consumption. During the period 21 months, September 1, 1926, to May 31, 1928, Lane County imported 51 cars of alfalfa hay, 10 of which originated at Klamath Falls, two in the Bend-Redmond district, and the balance eastern Oregon and Washington. While there is some holding, however, that there is to be an increasing consumption of alfalfa hay in western Oregon, I believe the actual
2223 facts point directly to the contrary. There is over 1,000,000 acres of lowlands in western—in fact, there has been about 150,000 acres reclaimed through drainage in the past five years. This land is excellently adapted to the growth of alfalfa hay. Washington and Yamhill Counties are now producing alfalfa hay, and with the reclamation that is going on with drainage I feel certain that instead of importing alfalfa hay into western Oregon it will be growing all they need for local purposes within a few years, but, in any event, with the hay of the Rogue River Valley, the Klamath territory, the Bend-Redmond district, the Stanfield irrigation district, I question the opportunity for western Idaho, southern Idaho, Harney County, et cetera, to send very much hay to this western Oregon.

Douglas County, it is estimated 480 cars of hay—or Coos (4013) and Curry—with a potential increase of 240 cars within five years. Now, the total movement into Coos County of hay from all sources in 1926—that is, I mean all sources so far as rail haul is concerned—was about 144 cars. Of this total, 133 cars originated on the Southern Pacific lines in western Oregon, 19 cars being shipped from Lane County and 67 from Linn County of that 133. Mr. Teutsch's information with respect to hay going into Coos and Curry Counties is entirely overoptimistic. It is right directly against the teachings of the Oregon agricultural college to-day, and, happening to be somewhat connected with development work myself, I know that they are producing more of their own forage in Coos County, and the encouragement and the teaching is all in that direction. There can be no such movement. There never has been a movement in its history into Coos and Curry County of 480 cars of hay in any one year, and that was even before the railroads were there.

2224 I think that covers all I have to say in regard to the potential movement of tonnage as far as our lines are concerned. (4014.)

In connection with my testimony on these products of agriculture, I recall that Mr. W. G. Ide testified that with respect to the lands in central Oregon under Federal ownership and open to entry, that he had a circular letter which he kept prepared and on hand with which to answer inquiries made by prospective settlers. I have asked Mr. Ide to let me have copies of that letter.

(Said letter was thereupon received in evidence, marked "Defendants' Exhibit No. 116, Witness Mulchay.")

I have prepared some exhibits on lumber. I have prepared a statement, consisting of four pages, showing the amount of standing timber in various counties in western Oregon, including the Klamath Basin, the number of sawmills in each county, their potential cutting capacity on an eight-hour per day run, also the number of mills and their capacity located at Portland and along the Columbia River (4015) between Portland and Astoria, with some other added information that I thought might be of value.

I also prepared another statement showing the amount of forest products produced by mills in the States of Oregon, Washington, also British Columbia, during the calendar years 1923 to '27, inclusive, showing the distribution as between shipment by water and shipment by rail during the same period.

(Said two statements were thereupon received in evidence, marked respectively, "Defendants' Exhibit No. 117, Witness Mulchay," and "Defendants' Exhibit No. 118, Witness Mulchay.")

2225 The reason I have prepared these exhibits is because there has been so much said in this record, also the former hearing, about the potential fir lumber tonnage, but without consideration being given, in my judgment, to the detail of where the lumber was to be cut or how it was to move and where it was located, the idea being throughout that Eugene, Oregon, was a central point. I will not take any extended time in an analysis of this statement, except to point out that the Portland-Columbia River mills have a potential cutting capacity (4016) of 8,752,000 board feet today. There are also 10 mills on Coos Bay with a potential cutting capacity of 1,470,000 feet. To these can be added properly mills at the mouth of the Siuslaw River, at Reedsport, and on Yaquina Bay and on Tillamook Bay. The rail output at Coos Bay does not exceed 10 per cent of the cut. About 50 per cent of the cut from the Siuslaw, Reedsport, Yaquina, and Tillamook Bay mills moves out by water. Now, the total potential cut of these tidewater mills is in excess of 11,000,000 feet per day, or 3,300,000 feet per annum, representing on an average car of 25,000 feet 132,000 cars per annum.

In the other statement—that is Exhibit No. 118, it will be noted that for the five-year period Oregon has exported by water consistently about 29 per cent of its cut. The State of Washington, on the other hand, has exported approximately 50 per cent. As is well known, the timber immediately adjacent to Grays and Willapa Harbor and on Puget Sound—all in the State of Washington—is decreasing, and as time goes on and mills along the Oregon coast

and Columbia River will be called upon to furnish an increas-
2226 ing amount of tonnage by water. This situation has been clearly apparent for a number of years, and, regardless of what may be otherwise stated, there is every (4017) tendency, every indication, for an increasing cut of timber in western Oregon at tidewater mills.

Our log hauls to Portland and Coos Bay and Tillamook Bay are increasing, regardless of the efforts we make to encourage mills to locate in the Willamette Valley. Our log hauls to Portland at the present time range from 65 to 75 miles, and when the short line logging roads are taken into consideration the distance averages from 75 to 90 miles. On Coos Bay the log hauls there range from 40 to 50 miles. In the case of the Coos Bay Lumber Company, however, the log haul in their case at the present time is 91 miles; that is, using the Southern Pacific line from Powers to Marshfield, plus the distance to their logging road. The overland rail tonnage is not increasing. It is not going to increase in any appreciable quantity. According to the statement which all the carriers west of the Cascades furnished to the West Coast Lumbermen's Association covering the shipments in the years 1925, 1926, and 1927, it shows that in 1925 the total movement west of the Cascades via all lines was 102,105 cars—Oregon and Washington—and covered all territory east of the Oregon-Washington-Idaho State line and south of the Oregon-California State line. In 1927, two years later, the movement was 105,324 cars. (4018.) This year there is every indication that the movement will be less than it was in 1925, predicated upon the first six months of the Southern Pacific in 1928.

In talking in my daily business with people who are interested
in timber holdings, I am daily confronted with the question
2227 of log hauls to Portland. I have on my desk at the present time four requests, insistent requests, that we haul logs a distance of 125 miles in one case, and 175 miles, in the vicinity of Eugene, and it is a question of every effort that I have made to encourage the building of a mill, but I am told that timber, comprising in excess of 2,000,000,000 feet in one large holding, that it would cost to build a mill, town site, logging roads, and, at the present day which would be necessary, a pulp mill, would cost in excess of $7,000,000, and the parties insist that the timber must be moved, for the reason that part of it is owned by an estate and in the settlement of that estate some disposition must be made of the timber. That is only one of similar situations that exist. In addition to that, there is coming into this country the development of the pulp and paper industry. All of these pulp and paper mills of any size are being located on tidewater. They are drawing their raw material from the interior. We hauled last year 2,700 cars of logs in gondola cars from our Coos Bay branch to Oregon City, a distance of 187 miles, to (4019) feed the paper mill at West Linn, whose outbound product moves entirely by water, very little of it

moving by rail. That is about 18 miles south of Portland. They move timber from the lower river by their own boats to the mill, and they also move spruce into the mill from points on our rails. They move the finished product by their own boats. We moved about 400 cars of spruce wood from our Tillamook Branch—in fact, Tillamook itself—to Oregon City last year for the manufacture of paper. All of these conditions, they dovetail in with the fact that tidewater is becoming more and more a central location for industry.

None of these people have put up to me the proposition that they do this because there is service by only one railroad to their
2228 timber. There is nothing in that proposition. To the contrary, they want to locate or sell their logs to mills located in or immediately adjacent to large (4020) centers like Portland, where they can sell their products, their slab wood, and, as is a well-know fact, some of the mills in the city of Portland, their overhead, a considerable portion of it comes from their sale of sawdust and slab wood. In fact, that is a matter of record in a case involving lumber rates at one time to the east. Further, the fact causes the price of logs in the Willamette River to be from $2.50 to $3.00 per 1,000 feet higher than the mills in the interior can afford to pay.

I would like to add this, and that is, that, summed up, I don't anticipate there is going to be much increase in the production of lumber in the interior along the rails, because the intercoastal and off-shore movement, the opportunity therefor, makes tidewater so much more attractive location with the owners of the timber, that the mill that will cut it will be on tidewater. I might also add this, Mr. Dey, that there is at the present time consideration being given to movement of a large tract of timber 40 miles west of Portland through the building of a logging road to Tillamook and towing the logs from Tillamook up to Grays Harbor. There has been a good deal of towing of logs to California. (4021.)

Q. In rafts?

A. That has taken place here for a number of years, both from the Columbia River, the mouth of the Siletz River, and from Coos Bay.

As to the situation as it existed when the cross-State line was first surveyed, and as it exists to-day: There has been a material
2229 change in conditions. First, during the war and prior thereto the carriers had authority to make rates on transcontinental traffic in competition with water carriers, operating, first, around Cape Horn and over the Tehauntepec route, and through the Panama Canal. During the war, however, as reported in fourth section application of transcontinental roads, decided June 30, 1917, 46 I. C. C., page 236—the authority for fourth section relief was withdrawn, both as to eastbound rates and as to westbound rates, with the exception of wool. The wool fourth section authority was withdrawn in July, 1924, in 91 I. C. C. 236.

I recall when the Oregon Eastern was first talked of, and I happened to be in a position at that time in the Oregon Railway &

Navigation Company's offices where I had opportunity (4022) to know in a general way reports and recommendations to my superiors, and I think it was in 1905, or 1904, probably, when they first commenced to talk about a cross-State line. Now, it wasn't within the foresight of anyone at that time that the carriers would ever be denied the right to meet water competition. At that time they were handling a large amount of tonnage east and west bound in competition with water lines. In addition, they had a large amount of tonnage of import and export traffic, originating in the Middle West, going to the Orient, cotton from the South, with Oriental products moving through the Pacific coast going to the East. They did not, and could not, imagine that all the traffic east of Chicago, for instance, at the present time, would move via the Atlantic seaboard or via the Gulf, they could not imagine or foresee the operation of the Government barge line on the Mississippi River, but to the contrary, Mr. Harriman and the officers figured at that
2229½ time that the Pacific coast was going to develop, and that there would come large tonnage, predicted upon that which they had been handling, east and west bound. I do not criticize, but undoubtedly Mr. Harriman and the other officers, as I recall it, at that time had those things in mind. The Milwaukee must have had that in mind when they decided to extend west; likewise when the Western Pacific was first thought of, in 1909 when it was completed. (4023.) Mr. Harriman, as I recall the plans of those days, correspondence that I have seen, reports that I have handled—and in one case I received all the confidential reports sent in by field men in connection with one of these projected lines, and from them I built the so-called estimated earnings return. Someone else figured, however, the revenue on that. Now, it was Mr. Harriman's intention in welding together the Harriman system to develop branch lines in Oregon, he was going to Puget Sound, and he figured that with the Puget Sound tonnage, with the tonnage to be produced around Portland and in the immediate vicinity of Portland, that the Columbia River route of the O. R. & N. would have sufficient business to be operated to its maximum, therefore, that the line which he intended to drive originally from Drain west to Coos Bay before they had a harbor to amount to anything, that the tonnage for the cross-State line, so-called, would be produced in northern California and western Oregon and relieve the Columbia River line, it being well known that that line could not be double-tracked except at a very heavy expense.

Now, at the time the Southern Pacific and the Union Pacific con-
solidated under the Harriman regime in 1901 one of the first
2230 acts was to readjust the rate situation. All rates to and from Oregon were cancelled within a period of two years so far as they applied via Roseville and Ogden, and the business forced to move via Portland and the Union Pacific. There were (4024) no rates at that time via Portland in connection with the Northern lines, with the exception of a few class commodity rates with the

Northern Pacific. In other words, all of the traffic produced in western Oregon, or expected to be produced, in the territory served by the Southern Pacific, was to be controlled absolutely to the Union Pacific route through Portland or other lines that might be required to handle it. At that time the O. R. & N. Company operated a steamer line between San Francisco and Portland in competition with the Southern Pacific. We used the steamer line to feed the route through Portland, all together adding to the tonnage that would support the lines. Now the situation has entirely changed. Business outside of lumber, as very clearly shown, in my Exhibit 114, the business of all character moving eastbound other than lumber is a very small amount, and consists principally of agricultural products, westbound it is very small. That is to say, all this tonnage of canned goods, dried fruit, wool, hops, and other traffic of western Oregon that in those days moved by rail and moved over one route has been taken away from the carriers.

Locally here in Portland the production is all north of Eugene—that is, so far as quantity is concerned. In fact, north of Albany is the chief production. The Oregon lines of the Southern Pacific lost this traffic eastbound, they make low rates into Portland,
2231 they haul some (4025) in by trucks—paper from Salem and other commodities. You will find the last item that we could rely on, and which was the big item in those days, a large item today, is being influenced by tidewater, and that is lumber. We had every reason prior to 1915 to expect that business to the east by rail and west by rail would be on the increase, but seeing it slip away it makes it all the more important—in fact, all the more necessary—that the Southern Pacific take the same action that other lines are doing, that is, to hold to their rails every ounce of long-haul tonnage they can secure, and that we propose to do.

There is another item for serious consideration by the Southern Pacific, and I mention it simply because it is an element to show the reasons why the carriers were obliged to seriously consider some of these matters: There is pending before the Interstate Commerce Commission on rehearing application for permission to meet water competition between Portland and San Francisco, Oregon points and California. A decision was rendered something over a year ago providing that the rates between San Francisco and Portland should not be less—the rates by rail should not be less than nine cents per 100 pounds higher than the boat rates, and that the rates to and from interior points should be based on the local rates to and from the ports, with a maximum rate of 100 per cent to high point—or interior high point. The effect of this will be to turn over to short-haul at Portland and at San Francisco (4026) Bay considerable tonnage that the Southern Pacific now handles up and down be-
2232 tween here and California by rail, because the differential of nine cents is so wide that there will be no opportunity whatever for the Southern Pacific to meet boat competition. Earnings

necessarily will be reduced from that source, leaving for support of the parent line and support of our Oregon lines a lessened avenue for revenue return.

The Southern Pacific didn't have the competition of the Oregon Electric in those earlier days, didn't have the competition of the trucks, or the United Railways or other subsidiaries of the Spokane, Portland & Seattle Railway.

When I saw those reports and correspondence I was in charge of files for Mr. Ben Campbell, Mr. R. B. Miller, Mr. James G. Woodworth (4027), at Portland, Oregon, in the office at the corner of Third and Oak Streets, in the Worcester Building. I went to work first for the O. R. & N. Company in 1889. I was quite a young boy. These files came along in 1904, '05, '06, and '07. I had special interest in the matter at that time. I was learning. I don't believe I would have been given the opportunity to handle some of these things except that I was ambitious, night and day work didn't make very much difference to me, and thereby I got the opportunity.

Cross-examination:

As to Exhibit 109. The principal shipping points that are shown for those different counties on pages 2, 3, 4, and 5 of the exhibit, are (4028) the points of origin in the various counties that form the basis for the distances shown in all my exhibits that have to deal with distance. Those are the points we name. As to what considerations lead to the choosing of those particular points in the various counties, as I stated when I explained the exhibits, we took the
2233 principal shipping points, that is, the points in each county that were representative of the largest tonnage producing stations. I didn't confine it to lumber. Confined it to dried fruit, canned goods.

Exhibit 114: Sheet 8 is simply a recapitulation of sheets 2 to 7, inclusive.

Q. Exhibit 118, on sheet 2, for 1927 the shipments of fir lumber from Oregon by rail amount to just short of two billion feet. I have calculated that at the rate of 25,000 feet to the car, which would make almost exactly 80,000 cars. Could you say approximately how many of those 80,000 cars the Southern Pacific originated, of fir lumber? (4029.)

A. As I recall it, our loading of 1927 was 50,000 and a fraction. That covered local movements, export, re-manufacturing.

The coast group lumber rates applies blanket from the British Columbia line to the Oregon-California line, from all main line and branch line points on all of the major carriers west of the Cascades, in both Oregon aand Washington. That includes, also, a number of short line common carriers on which the common point rate has been extended to apply.

After the Union Pacific-Southern Pacific merger was dissolved, the joint rates were re-established via Roseville and Ogden. We re-established the rates on lumber (4030) almost immediately after

the dissolving of the merger, and opened up the rates to the Denver & Rio Grande, and then a little later we put in all class and commodity rates, east and west bound. We didn't cancel any rates via Portland, either east or west bound.

2234 Q. You mentioned your inability to induce the building of lumber mills in the interior for the manufacture of lumber at points served by the Southern Pacific, didn't you?

A. I didn't mention only the Southern Pacific. I referred to all roads. The same situation, I may explain, exists right today in connection with the extension of the Oregon Electric east of Albany into the Santiam territory; it is going to be a log-haul proposition to Portland, with small portable mills, or small mills, cutting 40 or 50 or 60 or 70 or 80,000 feet of timber to cut so-called second-grade, but milling to cut 2 billion feet of timber requires a mill of considerable magnitude, and that costs money.

Q. But the reason as I understood you gave for the inability of the Southern Pacific and other railroads serving timbered (4031) areas in the interior to induce the construction and operation of good sized or large sawmills at interior points was that the persons interested in the cutting of that timber insisted on making their investments in mills that would be located on tidewater?

A. Yes, sir.

Q. What is the advantage from a transportation standpoint of having a mill located on tidewater?

A. Well, Mr. McCulloch, in answering your question, I stated "interested in mills." Now, in some cases the people who own timber don't desire to go into a milling operation; they desire to sell the timber in the log. In other cases, with Portland mills, their log supply diminishes, and there are several of them here have gone south of Portland and purchased large bodies of timber, and that will all be cut here; that is, timber that we expect

2235 sometime to be on the rails will be brought out here in the log. Then there is, of course, some—and in the case I mentioned, the parties are willing—or were willing a year and a half ago—to consider the building of a mill, but they tell me very frankly that finance will not permit that, to build a sawmill with a production already over and above the consuming market, but they must dispose of their logs, and a mill on tidewater, if he can buy logs in the open market, will defer cutting their own timber, conserve their own timber for the future, and buy in (4032) the open markets; he knows if those logs can be brought into Portland or into Coos Bay mills owning their own timber would buy the logs and defer cutting their own timber nearby to Portland, because it is constantly growing in value. That is the reason why mills are not going to go into the interior—both of those conditions. (4033.)

The advantage to the lumber mill from the transportation standpoint in being located on tidewater is, first of all, he has the advantage of water transportation to all points of the compass, foreign.

intercoastal, the Orient. In addition, he has the opportunity for good local market to sell his slab wood, to sell his sawdust, and he has a good labor condition. He does not have to provide housing for his employes, or anything of that kind.

Q. Isn't there another reason also? Is there any point in Oregon or Washington, that you know of, on tidewater, where large lumber mills are located now, that does not have the advantage of railroad transportation furnished by two or more competing railroads?

2236 A. No; I think that is true. There are mills, however, on one line of railroad.

Q. But the great concentration of lumber production in Oregon and Washington is at points where there are the advantages not only of water transportation but also of rail transportation by two or more lines of railroad; isn't that correct now?

A. No, sir.

Q. Keeping in mind Puget Sound, Grays Harbor, and the Columbia River?

A. No; I can't subscribe to that, Mr. McCulloch, in whole. I will admit there are mills served by two or more lines of (4034) railroad, but I have heard a great deal of this question of mills on two lines of railroad. We have heard a whole lot said about the Weyerhaeuser people building a mill at Klamath Falls so they would have two lines of railroads or they would not build it. Now the Weyerhaeuser mill is not located on the Southern Pacific at Klamath Falls, and they are probably not going to have the service of the Southern Pacific at Klamath Falls, because they have so located their mill it makes it difficult for the Southern Pacific to serve them; yet the theory was they would be on two lines of railroad. Now Mr. Woodard had an opportunity at Silverton to have two lines of railroad. He didn't take any advantage of it. And my experience is, Mr. McCulloch, and I am dealing with timber propositions all the time down on the Southern Pacific, it is not a question of two railroads; it is a question of mill sites in many respects in the interior, and other conditions. But tidewater has the advantage, as I stated a while ago, and that is why tidewater gets the mills.

Willapa Harbor only has one line of railroad, in many
2237 respects, the mills there, and has not had for years. That is in Washington.

Mr. DEY. Mr. McCulloch's question, though, Mr. Mulchay, was Oregon and Washington; whether any large mills on the harbors of those two States are served by one line of railroad. (4035) How about Coos Bay, Tillamook and Yaquina?

A. Well, Coos Bay has two large mills. The Hammond Lumber Company, whose mill burned down at Astoria, they are operating, have a large operation at Garibaldi. Mr. C. D. Johnson built a large mill at Toledo locally on the Southern Pacific, one line of railroad, completed and started operation in 1923. The Umpqua Mills & Timber Company built a large mill, operates at Reedsport on the

Southern Pacific. They ship some by water, and they ship some by rail, but there was only one line of railroad.

Q. (By Mr. McCulloch.) I had mentioned in my question, Mr. Mulchay, the concentration of large sawmill production. It was not referring particularly to individual operations of fairly large size. But take the mill at Marshfield, isn't it a fact that that mill has two means of transportation to the eastern markets of the United States, and, generally speaking, to the world, one rail and one water?

A. Mr. McCulloch, that is true, but——

Q. Isn't it true of Mr. Johnson's mill, that the Pacific Spruce Corporation——

A. Has tidewater.

Q. Yes; and rail also, hasn't it?

A. Yes; but it is a single line of railroad.

Q. All right. And the mills now at Astoria, or formerly at Astoria, had both a rail outlet and a water outlet, didn't (4036) they?

A. Yes; that is right.

2238 Q. Whereas, as compared with those operations and the sawmills at Portland and Tacoma and Seattle and Grays Harbor and Willapa Harbor, your mills in the Willamette Valley and western Oregon have only one outlet, and that is by rail?

A. No—that is true, one outlet, but they have also, in the case of two large mills, outlet by rail, two rail lines, the mill at Salem and the mill at Albany. We make them low export rates into Portland. We handled some 5,000 cars last year over our east Portland dock to enable them to ship by water. Our rates on logs to the interior mill are less than they are to the tidewater mill. There are advantages, even though they are located on one line of railroad; in other words, every encouragement. But it is not the one line of railroad that locates these mills. I would like to answer your question, if I could understand what you want, Mr. McCulloch. I can say yes that the lumber mills that have one or two lines of railroad, in addition to tidewater, as market outlets, are much more advantageously situated than an interior Willamette Valley lumber mill, from the fact, they have the (4037) advantage of water, as I stated a while ago. If they have two lines of railroad it must be some advantage, of course.

Additional channels of transportation for any manufacturing operation, other things being equal, are of material benefit, as compared with a competing manufacturer who has less in the way of facilities of transportation to get his products to the market. But in the case of the Willamette Valley, I would like to say this: It is true that a mill only has one line of railroad; that is the Southern Pacific; but it really has four lines of railroad. It has the same rates via Portland in connection with the S. P. & S., and the Northern Pacific; via Portland, the S. P. & S. and the Great Northern; via
2239 Portland and the Union Pacific; via the Southern Pacific direct lines. Hence, while in the sense that there is only one set

of rails to that mill, it reaches all points of the compass just the same as if there were four lines of railroad built to it. It is not true that if the cross-State line were built and in operation, in that sense, the Willamette Valley would have five lines of railroad.

Q. You mentioned the competitive rail service that celery growers at Brooks and Quinaby have. In your judgment is (4038) that of benefit to those celery growers, or not, that opportunity that they have of using the shipping facilities either of the Southern Pacific or Oregon Electric?

A. Why, Mr. McCulloch, there is no competition about it. The celery that is grown adjacent to the Southern Pacific tracks moves out via Brooks; that which is adjacent to the Oregon Electric tracks at Quinaby moves out through Quinaby over the Oregon Electric. Now the reason why it started on the Oregon Electric at Quinaby was because that was the first end of the lake that was really reclaimed by these Japanese, but now as the acreage has increased and swung around it comes about the majority of it is on the Southern Pacific's side and goes into Brooks. There is none hauled from Quinaby, although it could be hauled from Quinaby, over to Brooks, if they wanted to do it. There are growers located all the way in between Quinaby and Brooks. But it is sold through dealers; what I mean is, an agency; and that agency dictates to the grower where he wants the celery hauled. Now if he is operating at Brooks, the celery is hauled, that is tributary to Brooks, to the Salem side—to the Brooks side. If it is tributary to the Quinaby side, he orders the growers to haul it to Quinaby, and it is packed there.
2240 That is the way it is handled. (4039.)

I mentioned broccoli. Both grades, number ones and number twos, fluctuate in prices up and down during a particular day, depending altogether on the condition. I showed different prices for the fancy grade and for the fair grade.

Q. But I was wondering if you meant that in any single day the prices on the fancy grade would fluctuate up and down?

A. Oh, no. Those are what are called opening prices in the morning, as I understand it. That is, the price at which the market opens, reported price, or basis of sales of that particular date.

Q. Now, it is these prices that you say will fluctuate up and down during the course of the day, these opening prices?

A. No; they fluctuate up and down every day. I don't say that during the day the opening price will fluctuate. It is my understanding that the opening price in the morning is the price that is maintained for that particular (4040) grade during that day. My understanding is that these are the average prices that are received by the dealers for broccoli on that particular date at Chicago, on the Chicago market. I do not know whether they may fluctuate up and down during the day for a particular period.

Q. All right. Now I understood you to say in connection with these shipments of broccoli, that the present efficient service of the

Southern Pacific via Roseville could not be split up so it would be as good if over two routes as it is over your Roseville-Ogden route now?

A. No; I don't say that over two routes. What I meant to convey was this, Mr. McCulloch: This product moves over a period of
2241 about 60 days, and there is 300 to 350 cars in the average year, the last three or four years. Taking that over a period of 60 days, you haven't a great many cars per day to move. If there is 10 cars shipped today, 6 of those are ordered south via Roseville and 4 via Portland, we have got to split our service both southbound and northbound. Now we would prefer to take and consolidate the 10 cars and put them into what we call a block, adding out a few more cars of dead freight, or something of the kind, and run them into Portland rather than take them as a split proposition to Roseville. (4041.) From the standpoint of carrier convenience, instead of sending part of them via Roseville and part via Portland, instead of splitting them that way, we would rather send them all via Portland, because we can give better service. It is not a question of efficiency. I didn't mean by what I said to suggest that the Southern Pacific service via Roseville on broccoli would deteriorate in any way if the cross-State line were built and were competing for that business. The Roseville route is there, and it is going to be there, and it is going to give service.

The Southern Pacific handles canned goods from western Oregon east through Roseville and Ogden.

Q. Are those shipments nearer to Portland than—on an average weighted mileage basis, so that it would make a shorter route to the East than they are to the Roseville gateway?

A. No. In making my weighted average I did not use any cars originating in Multnomah County; and the fact is, Mr. McCulloch, we do handle canned goods from all western Oregon. We handle them out of Portland via Ogden. (4042.) We handle all our canned goods traffic in western Oregon via Portland and east that we can get, the majority we handle goes via Ogden; but we bring some via Portland that is routed this way. But I wanted
2242 to make to you clear in answer to what I thought you intended; that was, do we handle any business via Ogden that originates here in Portland? Now the fact of the matter is, we actually handle business out of the canneries at Portland via Ogden. In fact, we had a car only yesterday, Mr. McCulloch. If the cross-State line were built and in operation our canned goods tonnage of western Oregon would be closer, on an average weighted mileage basis, to Portland than to Crescent Lake. Our canned goods tonnage going east from western Oregon, on an average weighted mileage basis, would be nearer to Crescent Lake than to Roseville. The same rates east apply via Portland as via Roseville on canned goods. (4043.) The rates on canned goods are the same via Portland and the Union Pacific, the Northern Pacific, and Great Northern, as are in effect via Roseville. I am sorry to say it, though that is the fact.

I think the building and operation of the Altural line of benefit to the producers and shippers of western Oregon. I hope that we will make some faster time over the line than we do via Roseville. I expect this: We will have a little shorter time. I don't know how it will improve the service very much over Roseville, but we will have a little shorter time. It will give us an opportunity to increase our business to and from Portland where there is a natural aversion to routing via Roseville. Now we haul into this city, some 30,000 cars of logs a year——

Q. Remember, Mr. Mulchay, I don't want to interrupt you but I (4044) was asking the question to get your judgment of the benefits from the producers' and shippers' standpoint in western Oregon, of the construction and operation of the Alturas line.

A. Well, of course I was talking from the point of justification. Why, yes. I can't conceive of any shortened mileage
2243 not doing somebody some good.

Q. Any additional railroad route or outlet to markets that provides a new route where there was not one before, and with that new route providing saving in time and material saving in distance, in your judgment could not help but be of benefit to the producers and shippers of western Oregon; isn't that correct?

A. Well, that depends on conditions, Mr. McCulloch; it depends entirely on conditions. Because time in many cases makes no difference to the shippers or consignees. Otherwise we could not possibly make the showing that we do with respect to taking business out of western Oregon through Roseville.

As to whether there are any reasons which I have assigned as benefits to be derived from the Alturas line that will not likewise apply to the cross-State line, I don't know anything about the cross-State line. (4045.)

Q. I understood you to testify that Portland was the natural outlet and natural gateway for western Oregon fruit shipments, or Willamette Valley fruit shipments?

A. Yes, sir. As to why it is the natural gateway, I thought I explained that in my direct testimony. Because much of this Willamette Valley traffic is handled by dealers here in Portland. It is moved through here for diversion purposes, and others. Now we handle apples out of the Willamette Valley via Ogden, but the majority of them come via Portland. We wouldn't have dealers at Eugene if we had a cross-State line. Willamette Valley apples go to Texas; they go some to the Middle West, but it is mostly the Southern States that the Williamette apple goes to.

There is an advantage to western Oregon fruit shippers in having their fruits handled via Roseville during the heavy shipping season of perishables, when we are handling 700 or 800 cars a day
2244 through Roseville, because, as I stated a while ago, we handled some 50 odd cars of celery last year via Roseville; through Roseville. (4046.) I have never seen the Roseville gate-

way congested by reason of the large amount of perishables that we handle there during certain months of the year. Some of the biggest and most magnificent yards in the United States are there. It is among some of the largest and most magnificent railroad yards in the United States.

I think it is an advantage to Oregon for perishable traffic to be thrown in with the heavy California tonnage, perishable tonnage, which moves in very large volume and in lots of 700 or 800 cars a day. It is like a passenger train; it goes along, and it is broken up, and there are cars put into it here and there to get better service than it would if all those trains were split up. Now Oregon is benefited, where she has got four or five cars a day, to have those cars put into a solid block of perishables that runs just like a passenger train, is never broken up until it gets to its (4047) destination. No matter how many cars of perishables we may be handling through the Roseville gateway the traffic does not slow down; the year around we have those trains through Roseville. We handled over 18,000 trains in the year of 1926 eastbound of perishables through Roseville, and I believe there was only five of those trains that were late. Now 18,000 trains of perishables is something that you would not have out of Portland, Oregon. There have been no complaints that I know of about delay in handling our celery shipments from the Lake Labish section. We aim to give these perishables the finest kind of handling. To my knowledge there was never a car that we were asked to hold up and run slow; we never had a request of that kind, and I am pretty certain I would know. (4048.)

2245 I stated we expected to increase our business from western Oregon to eastern destinations by shortening our route through the Alturas line. As to whether we will take that business away from the Union Pacific or other lines, or whether that will be new business, I am going to do my best to take some of it away from the other lines. And I think we can get some of it by reducing our mileage 200 miles; at least I am going to try.

Q. Do you know of any reason why the Union Pacific could not get some of yours by reducing its mileage or reducing the mileage from western Oregon 400 miles?

A. Yes. They would have to get it.

Q. You don't think they would get very much of it under the present method of solicitation in western Oregon, do you?

A. What do you call "present method of solicitation"?

Q. The way they are soliciting. You know how they are soliciting now.

A. Now, how is it? If you know you can perhaps tell me something I don't know.

Q. I don't pretend to know how they are doing it, Mr. Mulchay.

A. Well, I know that they are a pretty aggressive lot, and if you sat at my desk for thirty days you would find it out. (4049.)

Q. How do you account for the fact, Mr. Mulchay, that out of the various lumbermen who have testified on the stand here in this case, there have been only one that I recall that remembers ever having been solicited for lumber shipments via the O.-W. through the Portland gateway?

A. I believe he said that an officer of the company had not solicited him. He did not refer to the soliciting staff; and I kidded Mr. Huggins about that to-day. Now, Mr. Huggins has a traffic manager who handles all of his business, like most all of these mills, and the solicitor gets to the traffic manager for the business.

2246 Q. And you think Mr. Huggins didn't know what he was talking about at all?

A. No; I don't believe Mr. Huggins knows exactly what he is talking about when he said——

Exam. ROGERS. There was more than one of them said that, that the O.-W. had been around.

Mr. DEY. Yes. Mr. Woodard said today that he was solicited.

Mr. MCCULLOCH. He said he didn't know.

Mr. DEY. McLeod said he was solicited.

I know something about the bulb industry down in southern Oregon. I know it is there and that it is developing. (4050.) It is just a new industry that started in the last year or so and I have had some interesting correspondence with the Department of Agriculture at Washington trying to help them. I expect some rather substantial shipments from that source during this coming season, but not to the extent of 40 cars per annum. That stuff is going to move largely in small quantities, by parcel post and by small express.

Q. Ten years ago wouldn't you have said that a man was a very extreme optimist if he had told you how many cars of celery you would be moving out of the Labish meadows?

A. No, sir. Nobody can tell me anything about what we can do down in this valley, because I am just about as optimistic as they can be. We were not shipping any such quantity of celery ten years ago as we are now. And it was not until the Japanese difficulties in California that we commenced to get the celery up here, the growth of it. That is what brought the Japanese in here, who grow it. I can say how much our celery shipments have increased from that section in the last few years: The first year that we commenced to handle any celery we (4051) handled 35 cars. That was in

2247 1925; 6 cars east via Ogden, 7 cars east via Portland. In 1926,244 cars, 12 east via Ogden, 172 via Portland. And 1927, 393 cars, 51 via Ogden, 232 via Portland.

We do not really have any substantial movement of logs by rail over our main lines; we keep the logs off of our main lines. Our regulations will not permit the hauling of logs on main lines at all unless in gondola cars; we have enough wrecks on the other lines without tying up the main line with a wreck. Logs can be shipped into Portland over our west side lines into Oswego and Menefee.

That is where the log dumps are. They do not necessarily have to be in gondola cars there. We do not have any log rates that will permit shipments of logs for distances of 100 or 150 miles, but they want us to make them. As a matter of fact, there have been many attempts to get us to make logging rates to permit that, but we have consistently refused. (4052.) We are going to resist it as long as we can, but how long that will be is a question.

I stated that the broccoli growers at Roseburg were very much discouraged, but it is not a fact that this discouragement is due to their inability to get their broccoli into eastern markets in a condition which can permit is to compete with California production.

Q. Don't you know, Mr. Mulchay, that they have used every means of preserving their product that is possible to use, in order to get it there in a condition comparable with the California product, and that unless that situation proves successful they are going out of the business entirely?

A. Well, no. Those are not the reasons at all. Now I know the Department of Agriculture has made some very extensive studies of this movement of broccoli, and we have helped them a great
2248 deal. Now I was reading some quotations from the Bureau of Markets. I would like to read one more.

Q. Well, have you something in addition to the prices that you read before in your testimony?

A. On March 17th, Saturday, central California, southern California, $1.90 to $2.00 for fancy; $1.50 to $1.75 fair. Oregon, $1.75 to $1.85 fancy.

Now you wonder why that differential. Trade prejudice (4053) against Oregon broccoli crate, and 10 per cent discount made on this account.

Q. A crate prejudice against Oregon broccoli, you say, is all?

A. New style crate. Now this year they adopted a new crate in the Umpqua Valley, which had a material effect on their prices.

As to whether I have any information as to what percentage of the broccoli from Roseburg was rated as first grade and what percentage was rated as fair when it arrived at the Chicago market, my understanding is that the majority of the crop was number twos on account of the hot weather. I can not agree that it was the length of time in reaching the destination. By hot weather I mean that just before harvest there came a warm spell and it ripened the heads quickly, ripened too quickly. I don't know whether California broccoli experiences that same difficulty or not; they may at some of the times, but I don't think so. It lies along the coast in California; right along the coast. (4054.) As to how long it takes to get the Roseburg broccoli to Chicago as compared with the California product, we brought the broccoli from Roseburg to Portland this season and last season in 13 to 18 hours. It was in Portland until along about 5 or 6 o'clock at night, depending on what time we could get out of Roseburg with the train.

Comr. McMANAMY. Could you give me the time from the time of leaving Roseburg until leaving Portland?

2249 A. Yes. Now here is the Chicago schedule, 99 cars the schedule being 203 hours, we made less than schedule on each car; just how much I don't know. Council Bluffs schedule, 176 hours, 7 cars less than schedule, 1 car over schedule. Denver, 9 cars less than schedule of 152 hours, 3 cars late. To Minneapolis, 178 hours, 2 cars less than schedule. Omaha, 176 hours, 24 cars less than schedule, 2 cars late. Portland, 89 cars out of 175, thirteen to 15 hours, balance 17 to 18 hours. Seattle schedule, 32½ hours, 20 cars less than schedule. Vancouver, B. C., schedule 58½ hours, 2 cars less (4055) than schedule. I am talking about broccoli now altogether, that is the schedule from Roseburg. I haven't got here the schedules from the California producing sections to the same destinations but you can figure 154 hours from Roseburg and whatever the time would be from the Colma district, which is the principal growing district, which is down in Half Moon Bay, south of San Francisco. That is about 118 miles on a direct line to Roseburg. Adding the Dumbarton movement will probably add 20 miles to that. As to how many hours that would be, that ought to be at least 10 or 12 hours. That is putting it at a minimum because there is a lot of broken service. I would not care to state just exactly what the time is. I haven't checked it up. There is some secondary or branch line service. I do not have here the records showing the leaving time at Roseburg and the leaving time at Portland. (4056.)

Mr. LOUNSBURY. The leaving time at Portland is ten p. m.

Exam. ROGERS. What time did it arrive here?

A. Well, we arrived here all the way from 1.30 p. m., 1.00 p. m., 11.30 a. m., 5.30 a. m.—all kinds of hours. You see, there was only

2250 175 cars went east this year, so the loading on any day was such that you could not give a block movement. This is just this year's figures, this year's time.

Exam. ROGERS. Well, is there one train that takes this broccoli out of Portland?

Mr. LOUNSBURY. No. We have another train that leaves at six o'clock. We could take it if it was here for that train.

And from Reiff it is 151 hours. (4057.)

Comr. McMANAMY. Have you received any complaints concerning the condition of Broccoli upon arriving on the Chicago or eastern markets, based on time in transit?

A. Why, yes. I haven't heard of any complaints recently.

Comr. McMANAMY. Have you paid any claims on that account?

A. No; I don't know as to that. I don't believe we have. But some few years ago there was complaint of the leaves turning yellow on arriving on the Chicago market. I think, however, the trouble was due to the fact we were not using top icing. Myself, I think since we have commenced to use top icing in the last two or three years that has disappeared.

Comr. McMANAMY. The carrier does not top ice in any event?

A. No, no. The shipper does, but the carrier does, I think, permit the loading of 9,400 pounds of ice in the car on top of the load, without charge.

Q. (By Mr. ELLIS). Do you know why the broccoli shippers at Roseburg have recently adopted the practice of shipping their broccoli in oiled paper, or sealed oiled paper bags?

A. I heard they were doing that, but I understand it is to make a nicer looking head for the public to see—sales proposition.

Q. You would be surprised to learn that that was a part of the protective feature that they are adopting to overcome their (4058) difference in time in reaching the market, would you?

2251 A. Yes; I would be very much surprised. I don't know anything about it myself, but I would like to know of that fact first.

Q. I have just about one more question. You, I understand, have stated that the only way that any lumber would move via the cross-State line would be through withdrawing and canceling the joint rates through all other gateways?

A. Yes, sir.

Q. I am wondering if you would say also that that is the only thing that will move any lumber over the Alturas line?

A. No, sir. First of all, I would like to say this to you, Mr. Ellis: Throughout this you are presupposing that the Southern Pacific can control this business. Now we can't control this business any more than you can control it; and the only way you can control it is to adopt the same policy that Mr. Harriman adopted in 1901, and that is confine all your rates to one gateway and force the shippers to ship over that gateway. That is the only way you are going to do it.

We certainly did have to close the Ogden gateway to get shippers to ship through the Portland gateway and the northern lines. We did not have any rates with the northern lines in those days. It is true we now have rates through Ogden and Roseburg; we put them back. In spite of that fact it is true lumber is moving through the Portland (4059) gateway, to some extent, to the northern lines. There is some moving to the Union Pacific, but we are soliciting and securing every pound of lumber that we possibly can for our long haul.

Q. Well, then, you didn't mean that just exactly the way you stated it, did you, that you would have to withdraw all of your rates on lumber through all other gateways before any lumber would move over the cross-State line?

2252 A. Well, of course if there was through rates in effect via the cross-State line, and the shipper routed the lumber over the cross-State line, it would have to move that way. But we haven't got any through rates yet via the cross-State line, and I doubt that we would have them. Assuming we had them, if a shipper routed

any business via the cross-State line of course we would have to obey his instructions.

Redirect examination:

I have been asked several questions about the usefulness of the Altural line to the people in western Oregon as compared with the usefulness of the shorter proposed cross-State line. I do not think it makes any difference because it is the Southern (4060) Pacific Company that is building the Alturas line and it is the Southern Pacific Company that is serving these shippers in western Oregon.

Q. Well, you think, then, the Union Pacific has just as good a chance to solicit business in western Oregon as the Southern Pacific has?

A. No, sir; I do not think they have the same chance.

Q. Well, don't you think, or do you think, that the ownership of the Alturas line by the Southern Pacific Company as distinguished from the Union Pacific ownership of the cross-State line, is not a factor in controlling the route over which this business is going to move in the future?

A. Yes, sir; no question about that.

Q. Well, then, is there, or is there not, a distinction between the usefulness of the cross-State line and the usefulness of the Alturas line to shippers located in western Oregon?

A. Well, there is no question about the usefulness of the Alturas line to the shippers in western Oregon located on the
2253 Southern Pacific lines. It is a benefit to them.

Q. Yes; and would the cross-State line be of just as much usefulness to them, or more?

A. It would not. It would not be of as much usefulness to them. (4061.)

(Witness excused.)

Comr. McMANAMY. Does this conclude your evidence?

Mr. DEY. Now that is the case for the carriers, except in the morning I may ask to hand in a small exhibit showing the proportion of Federal ownership and private ownership in the various counties that we have talked about; just a short statement in printed form.

Exam. ROGERS. Timber?

Mr. DEY. All land, all acreage, to show how much of the acreage of the State and of each of these counties is in Federal ownership.

Comr. McMANAMY. That may be done.

Mr. DEY. But there will be nothing else that I can think of. (4062.)

2254 PORTLAND, OREGON, *August 25, 1928.*

Mr. ELLIS. Were you through, Mr. Dey? You made one reservation last night.

Mr. DEY. Yes; all except one exhibit, and I will introduce that later. It will come up during the forenoon.

Comr. McMANAMY. Proceed, Mr. Ellis.

FOSTER BUTNER was thereupon produced as a witness on behalf of complainants, and, having first been duly sworn, testified as follows:

Direct examination:

I reside at Roseburg, Oregon. I have lived there 18 years. I am engaged in farming to some extent, but my main business is the shipping of broccoli. I am the manager of the exchange, Umpqua Broccoli Exchange. That is an organization of farmers for the sale and (4063) distribution of the broccoli. I couldn't tell you exactly how many members that exchange has. I would say offhand 200 or 300. It changes every season. I have been manager of that exchange six years, I think. That does not cover the entire period that I have been shipping broccoli from Roseburg. I shipped as an individual, independent shipping prior to that time. As to what previous experience, if any, I have had in the handling of perishable products, that is all I have ever done since I was about 12 or 15 years old, except a little schooling in Kentucky and Tennessee and other States. The nature of the work I carry on is buying, selling, packing, and shipping fruits and vegetables. That has covered a period of about 30 years, offhand. I am familiar in a way with the shipping and marketing of perishable products generally throughout the United States. I don't feel that I know it all. (4064.) I learn a
2255 little something every day, and I keep my eyes open, do the best I can.

As to the condition of the broccoli industry in the Umpqua Valley, its development and its problems: Well, the deal originated around 1914 or '15, I think, and after a few experiments, why, it has gradually grown into a large industry. I think their largest season was 1926, with approximately 1,000 carloads. We are by no means utilizing at the present time all the land in the Umpqua Valley that is suitable for the growing of broccoli. There has been a very gradual and very steady increase in the acreage planted to that commodity up until 1926, the large year; since then it hasn't been quite so heavy. I couldn't tell you exactly how many cars were shipped by our association this last season, but it was around 125, about half—we handle about half of the crop from the Umpqua Valley, which I think was 250. That was not a representative season so far as the proportion of the crop that we handle. (4065.) We handle less than previously. The deal has come more and more cut up this last season, more dealers cut into it. We sell our product I think in about 50 cities in the United States and Canada. I think the principal markets are New York, Chicago, Minneapolis, and St. Paul. Philadelphia is a pretty good market. The competition for the sale of broccoli is very keen in those principal markets. We come in competition with several markets in California. California is our only State as a competitor, but that means a lot—Santa Maria and Guadalupe, and around the bay district of San Francisco, all heavy shippers at the same time we are shipping. As to what
2256 gateways or routes of transportation those shipments of Cali-

fornia follow, they use the Santa Fe and Southern Pacific, I think. I don't know the exact routes. Ogden and Omaha, I presume, though. (4066.) As to what has been my experience in the principal eastern markets in competing with those producing districts, we found that they had the advantage of us in time getting to market. In the beginning, I would say they had an advantage of three or four days. We cut off a little of that by changing by the way of Portland instead of Roseville. (4067.)

We routed our shipments through Portland instead of Roseville to save time—the important factor in this business. Our product—of course, I presume the audience understands it is nothing more than cauliflower—it is called broccoli, but it is just a variety of cauliflower, a hardy variety, and the market value depends entirely on the condition of the product on arrival at market, and we have noticed it on any given day during the real movement that there will be prices ranging from $1.00 a crate or even less to $2.50 a crate at New York and Chicago, and that difference is by reason of quality and condition, and usually condition. I would say that there would be a greater variation in quality on the same day than in the market price from day to day. As to what extent is the variation in price as caused by quality affected or governed by time in transit, our experience is that if a car is a little late, it is always more or less yellowed, and yellow means a stale look to it. No matter how fine the head may be, if the leaves (4068) are discolored the product is discredited and sold for less price.

Exam. ROGERS. What is the difference in No. 1 and No. 2?

A. Well, the difference in the quality of the head there. The head that would be perfect and solid and white today and isn't cut today and should go until tomorrow will go to make a
2257 tinge of yellow, or the segments are spread, likely. We have no difficulty in marketing the broccoli on account of the packing.

Exam. ROGERS. What I mean, one fellow's package as against another's?

A. We have made some changes in the package, but the conditions of the crop itself has been the only problem.

I think in the last two years it takes about nine or 10 days to get a car of broccoli from Roseburg to Chicago. Prior to that it was a little greater. There has been a slight improvement, I think, in time. That is through the Portland gateway. I think we are getting now nine and 10; used to be 12 and 13. That is to Chicago. (4069) We were always longer that way. That is the reason we changed to Portland, because we not only get a quicker time, but we feel that the climatic conditions would be cooler, and also aid in the conditions.

I have information as to the condition of our broccoli upon arrival at the Chicago or New York markets, as compared with the condition of broccoli received from California. I have that, of course, mostly

through our connections and dealers, but in a few instances I have been on the market, I have observed myself. As a rule that product shows fresher and greener than ours, although we have a finer quality of head. Given the same time, we would beat them—time in transit, I mean. As to whether that condition on arrival at market had anything to do with the amount of broccoli we have grown and shipped, I would say this, that the better price growers can get, why, naturally the more they are inclined to grow, and the better condition we get at the market, why, the more the broccoli would bring and the more we are able to sell it for. We sell it f. o. b.—we don't confine it—but, of course, (4070) our prices are based on market conditions.

2258 In my opinion the construction of the cross-State line from a connection with the Natron cut-off near Crescent over to Crane would be of assistance to the broccoli growers of the Umpqua Valley, and that is the general opinion in our community. I think so much of it that I am spending my money to come down here and give my testimony in this case. If that line were constructed, I would route my product that way absolutely. As to whether, in my opinion, other shippers of perishables in the Umpqua Valley and in western Oregon generally would generally route their traffic that way, if it meant a saving in distance and time, if there is anybody in our community that doesn't want the cross-State line I haven't met him. From conversations and meetings, I am sure other shippers would route their traffic via the cross-State line. (4071.) It has been brought up at various growers' meetings and chamber of commerce meetings, and it has always been the unanimous opinion.

Q. There has been testimony by carrier witnesses to the effect that by reason of the fact that the Southern Pacific Company originates the traffic they would be able to, in their opinion, hold the greater proportion of it to their own rails for the long haul, regardless of the shortening of distance via the cross-State line. What is your judgment as to that?

A. Well, they tried to do that with me regarding shipments by way of Portland, but it didn't work. We go by Portland. I would change just as quickly over to the other way, because that would still be another saving, the cross-State line as compared to Portland, as I see it.

They were very anxious to get me to ship via Roseville, and I offered to give them a day's business providing they equalled the time, and Mr. Sproule declined the business. (4072.)

2259 Cross-examination:

I would say that approximately I shipped 120 cars. I don't remember the exact number. I couldn't tell you to what destinations. We saw, as I say, around 40 or 50 markets, usually, in the season. I haven't checked on this year's business. We went as far south as New Orleans, and I think we went to a number of Canadian cities, Toronto, Montreal—Boston and New York. As to how many cars we shipped this year to destinations to which the cross-State line

proposed here would have the shortest mileage, I would say all, with the exception of a few cars to Vancouver, B. C., or some market like that—to Portland or Seattle. The Umpqua Broccoli Exchange is our exchange, but I think the Southern Pacific Company's records figures that we shipped 88 cars is wrong, because we ship from more than one station. (4073.)

Q. Just a moment until I give you the figures, then we will see whether they are wrong or not. Portland, six cars, Seattle, seven cars, and Portland by way of the Union Pacific to the East, 75 cars, or a total of 88; is that correct or not?

A. I don't think it is correct, sir. I think we had more than that. I am sure we had over 100. I was under the impression it was between 100 and 125, but I didn't give any exact figure, because I didn't know it would be less. I could have looked it up.

As to how many cars were shipped east out of the district down there this year, I think that we shipped about half of them. I don't remember the exact number. Something over 200, though, I think.

Q. Well, the railroad company's records show 173, of which 163 moved Union Pacific by way of Portland, and 10 of them over
2260 the Northern Pacific by way of Portland. Do you know why those 10 cars were shipped through the Portland gateway by way of the Northern Pacific?

A. No, sir; I do not. I haven't heard of the Northern Pacific (4074) giving any special fruit service out of Portland. I don't know that they give anything special.

Only in the beginning, when we were more or less inexperienced did we route our broccoli through Roseville to the East. We changed to routing through Portland because, in the first place, we felt that we could get a better condition, cooler climate, that way than through the hot Sacramento Valley, and we changed for that reason, and we found that there was a saving in time, shorter distance. At the time that we shipped through Roseville to Chicago I think we were making about 13 or 14 days, somewhere along in there. After we changed through Portland we cut off about a couple of days. At that time we would be about 11 or 12 days from Roseburg to Chicago. That was back in the beginning; I would say in '20, '21, along in there. (4075.) There has been an improvement since then. I commenced changing the route from Roseville to Portland about '22 or '23, I think.

Q. Well, did you route anything through Portland to the East prior to the time that you telegraphed to Mr. Sproule, as you testified here a little while ago?

A. Yes; we had had it both ways, and the Southern Pacific was anxious for us to give the Roseville business, and in appreciation of the local employees I offered Mr. Sproule the day's business provided he would give us equal time, and he declined the business; he said we should let him route it as he pleased.

As to what year we first started the abandonment of the
2261 Roseville gateway for the Portland gateway and commenced

to move a substantial quantity through the Portland gateway, I don't think we changed over entirely. I think we were inclined to listen to the pleadings of the Southern Pacific. We couldn't afford to be mean (4076) with them. We didn't want to take the business away from them. They thought it was mean. It was just a matter of expediency with us. We were one and two, I would say maybe three, seasons in changing over entirely. When we made the substantial change there came a year when we routed everything through the Portland gateway. I couldn't tell you exactly what year that was. I would say '23 or '24, somewhere along in there. I couldn't tell you exactly what time they were making for us then through the Portland gateway from Roseburg to Chicago. As I say, the last season or two it has been nine and 10 days by the way of Portland. We haven't shipped any the other way, so I don't know what that time is now. We put all our routing through Portland to save time.

Q. You mentioned a telegram that you sent to Mr. Sproule. I will ask you if what I now read you is a correct repetition of that telegram: "Having had numerous controversies with the Portland management, have given Portland routing entire shipment several hundred cars broccoli. In appreciation (4077) wonderful service, loyalty, courtesy, your employees at Roseburg and other loading stations, also Mr. Rosenbaum of Medford, have decided to route entire shipments one day, probably 40 cars, by way of Ogden. Can you equal by way of Ogden route the time now being made by way of Portland averaging eight and nine days Chicago? Please answer." Dated March 5, 1926.

A. That is my wire. The controversy wasn't over that matter of routing, though. That was over an industry track prin-
2262 cipally. We wanted the Southern Pacific Company to put us in an industry track to our plant at the company's expense, just as they do in Phoenix, Arizona.

I think I have heard of order 15, issued by the Director General during the war period. That is regarding installation of tracks. I find, though, that the Southern Pacific anticipated in Phoenix the need of tracks, instead of waiting for the request of the shipper to build them.

Q. Well, you carried that controversy to the shippers' (4078) advisory board at Tacoma, did you not?

A. I carried it a number of places. I don't think I skipped Tacoma. That was the principal controversy I referred to here with the Portland office. That was not the underlying reason why I routed the shipments through Portland. I explained to various Southern Pacific officials, Mr. Mulchay, and a number of others, that my main reason was the saving in time. I have some good friends among their people, the S. P. people at Roseburg, and if the conditions were equal, regardless of my feeling toward the powers that be in Wall Street I would give the S. P. the business if they could equal the time. (4079.)

Q. (By Mr. DEY.) Well, what did you mean by this statement: "Having had numerous controversies with Portland management have given Portland routing entire shipment several hundred cars of broccoli"?

A. Well, there is nothing in that, only just to show Mr. Sproule that we didn't get along very well here together over the matter in some of the policies of the company. It was merely an attempt on my part to show my appreciation of the support toward the local men, my kindly feeling toward them. Mr. Sproule answered
2263 me. I could not tell you exactly what he said. Roughly my recollection of his reply is that he thought we should merely leave the movement of the cars to the carriers, and he didn't seem inclined to handle the business. He did not accept my offer to route those 40 cars, one day's business, via Roseville, in consideration of equaling the time that I claimed to get via Portland. I took it that he declined the offer. (4080.)

Comr. MCMANAMY. Now, you were asked concerning the land being suitable for broccoli. You stated that there were many acres there that were not cultivated that were suitable. Can you give me approximately the percentage? Could the present acreage be doubled, or how much could it be increased approximately?

A. Well, I could not answer that, Mr. Commissioner. I have never made any survey of it. I know it is merely a matter of price, and price depends largely upon the condition of the product in the market. I ship the product under top icing. I have been doing that ever since it has been in vogue, for a number of years. You can't ship without that. I have testified in previous hearings we let the P. F. E. experiment with that, and it cost them $1,700 on two cars by not using top icing. They paid the damage. We very seldom have a claim with respect to the condition in which they arrived at destination. We have a connection in most markets, an established connection. We have been doing business with them for a number of years, and they know our product, the way we pack it, the railroad conditions, and the time, and we are in the habit of selling it on an f. o. b. basis. (4081.) Under those conditions the claim would be made by the buyer. We sell it on the f. o. b. basis. Occasionally we ship cars unsold, and they are sold on arrival at market, but usually we sell on the f. o. b. basis.

There was just a small experiment made with shipping in
2264 sealed oil paper; to no extent. We would put a few of those crates in a car as loaded ordinarily for a matter of test, and while they went through as reported in a very nice condition, the trade does not seem to take them because they lacked the leaves. We trim them. Naturally, the reason for the paper was to eliminate the heavy foliage, to lower the freight cost; and, while the condition of the product was very fine, it seemed that the housewife or the buyer didn't like the product so well when it lacked that green foliage. That paper did not make any difference in the price. The

buyer took the car straight through, but he made the comment that he didn't think it would be practical. As I say, we only shipped two or three crates; naturally, the buyer knew we were doing it as an experiment. He didn't even give us any report further than to say "it looks very nice, but we can't sell it (4082) this way," or something to that effect. The paper was put on just to take the place of the foliage, at a less freight expense and for the purpose of preserving the product. We felt it would keep the air off and protect it and benefit it probably in that way. It would naturally have some protection. You see the leaf coming all around the stuff shipped upside down—we pack a crate with the heads up; when we go to put the top ice on it we turn the crate over, so it is like a duck's back; it would be shedding the water falling from the ice. As to whether the broccoli would keep better with the foliage or without it, the idea is to keep the foliage green. I think the foliage creates a heat. It is a green commodity and packed pretty tight in the car, with only slight ventilation, and that is the reason we have to put ice in there to keep it cool.

Our time through Portland to Chicago varies, nine or 10 days.

I think there is a record of it. I mentioned in that wire
2265 there eight days, but that was a record very seldom made in my experience. I asked Mr. Sproule to (4083) equal eight or nine days. I will be very candid, in saying that I wasn't giving myself any the worst of it there with Mr. Sproule. I wanted him to do his best, if he wanted to take that business.

As to when our shipping season begins, it varies—I think we have had cars move the last day of January and the first of February, and it lasts into April. As I recall it, when I offered the Southern Pacific Company the routing through Roseville on March 5th, that was in the peak of the season, the heavy movement, when I sent him this wire. It must have been when I offered him 40 cars. I have the reply Mr. Sproule made to that in my files at home.

Mr. DEY. I will read it into the record, if you wish. Mr. Foster Butner, Roseburg, Oregon: Your wire sixth—well, it means fifth. "Appreciate your consideration (4084) with train load of broccoli. Prefer movement be left to us to handle either by way of Portland or Ogden gateway as operating conditions may exist the date of the movement. You can rely on our desire to handle to best advantage for the shipper in any event." Signed, "William Sproule."

Mr. Sproule is president of the Southern Pacific Company; was then and is now. Mr. Paul Shoup that the witness referred to the other day is executive vice president of the Southern Pacific Company.

Q. You don't know, I suppose, Mr. Butner, as to whether or not it would be difficult, from an operating standpoint, figuring your power and lineup of movement of traffic, to switch a movement for one day in opposite direction through a different gate-

2266 way? That is an operating matter I suppose on which you would not be informed?

A. Well, from my impression, gained by conversations with the Southern Pacific men, that they had the service there and (4085) all we had to do was to hook onto it.

As to how many cars a day our shipments amounted to, it is very irregular, but I think that something like 30, 35, to 40, along in there, has been our peak per day. You know, that is in peak movement, the heavy movement. And ordinarily during the season, why, two or three, or four or five cars, just as conditions are. It is a weather crop. If the weather is warm you get a heavy cutting to-day, and if it turns off cold and you get a frost, it will be very light. We frequently have a little snow and frost. It varies frequently throughout the country—light frost. The movement extends over February, March, and part of April. Something like 60 days. This past season was a very light season. The heavy movement was 1926, and it was around 1,000 (4086) cars for the whole district. That 120 cars was my shipments, not the total movement for the district. As he has it, it was 80 odd. I don't remember the shipments. I don't think you could estimate the number of cars of broccoli that move per day out of that territory. As I say, it is a weather crop. If the weather would be warm to-day there would be a tremendous movement. If it turns off cold we have had to stop it almost entirely, I think, if there would come a cold spell. I think the railroad records and people will bear me out in that. It is a weather crop strictly. It is a flower that turns to bloom and it quits blooming when it gets cold.

2267 Mr. DEY. Mr. Butner, the year 1926, that season in which you sent the telegram, the railroad company's records show that you sent east through the Portland gateway 469 cars. That is about right, isn't it?

A. I think our exchange shipped over 600 cars that year. I don't remember. That was to all destinations, that that went through the Portland gateway. I would say offhand it was (4087) correct.

J. P. NEWELL was thereupon recalled and, having been previously sworn, testified as follows:

Direct examination:

I have prepared some charts to be introduced as exhibits.

(Said charts were thereupon marked "Complainant's Exhibits Nos. 119–128, Witness Newell.") (4088, 4089.)

Mr. Burckhalter called attention to the unbalanced condition of the traffic which had been estimated for the cross-State line, that the necessary empty cars for eastern movement were not fully accounted for. That was true, and I had noted—in my Exhibit 16 I spoke of that and stated the reason for treating it as I did.

I calculated against the cost of each eastbound car 60 per cent of the cost of the empty west, because that seemed to be a normal condition for northwest coast traffic. If I had treated it as it actu-

ally was, with about a 95 per cent ratio, the showing of saving would have been correspondingly greater on the empty cars, would have increased the apparent savings via the cross-State line. I did not do it because I think that that condition would not con-
2268 tinue to exist if that route were open through as a regular route for traffic. It seems to me it must, in all probability, at least, come to the normal conditions of the rest of the country. I would have used 90 per cent if I had taken the condition of the actual movement as it was in 1926. There were something like only about 5 per cent as many loads west as east. So there would have been a 95 per cent balance of empty cars required in order to supply the cars for eastward haul, my assumption all the way through being that the empty cars would come back the way the loads went. (4090.) I measure the necessary empties west by the loads going east. I presumed the empties would come back the same way the loads went; and that all necessary empties would be hauled by that same route. I included the cost of moving the empties in my calculation with the cost of the loaded movement; that is, that excess of empties over that which is provided by unloads at the western end. I include the saving. Then when I come to that I have the saving on those empty cars west as well. That is, I treat the eastward movement as a combination of an empty west to the extent of 60 per cent, plus the full cost of the load east.

As to the commissioner's question about calculating the cost, I haven't calculated the total cost of any of the movement; I have only taken the direct cost wherever I have it. I haven't calculated the total cost (4091) in that sense anywhere. I have calculated total direct cost, including necessary empty car haul in every instance. And the estimate of the number of empties to be moved is, of course, a factor affecting that cost. Now, if I had taken 95 instead of 60, I would have shown larger figures of gain by the shortened route.

Q. (By Mr. McCulloch.) Mr. Newell, just one more question before you go on. Does the cost of moving an empty car west
2269 to be loaded in western Oregon constitute altogether a direct expense, or is any of that cost indirect?

A. Well, I am dealing only with the direct cost, and whatever cost is thereby caused for the empty is a part of the cost to be attached to the shipment for which the empty is used. In getting the empty back into western Oregon for loading there is an indirect cost which has to be borne. No indirect cost attaches itself directly to any movement, either a load or empty. That is the very nature of it, that it is separate from those considerations. But in your considerations of how the indirect cost is to be met, that, as a practical (4092) question, must all be covered by the loads. The empties, of course, bring no revenue.

I was discussing my use of the 60 per cent ratio instead of 95 per cent. I was not attempting to balance those cars in that case; I was attempting to figure what those costs will be when the same conditions of relation of empties to loads have established themselves

over that new route that exist on the other northern routes. Now that is the explanation of why I used that. Now Mr. Burckhalter asserts that a different condition exists as regards this route, and I want to consider what the effect of that would be. He says, in effect, as I understand his statement, that there is a surplus of house cars in California which is provided by the natural flow of traffic to that State, and that this is normally sufficient to supply all the needs of such cars for eastward shipments from Southern Pacific points in Oregon. He says that there are no empty cars moving in from Ogden to Oregon, and therefore that there would none move either via Alturas or via Crane, and that consequently there could not be any saving in that empty car haul.

2270 Now, in justification of myself for not being aware of that as a fact, I note that Mr. Burckhalter himself said four (4093) years ago in the hearing that western Oregon was the hardest place in America to get an empty car into, and I can't understand how that condition can apply when there is a surplus of cars in the neighboring State for which western Oregon is the nearest point of use. I did not hear his further explanation in regard to that, but, as reported to me, I did not understand that he had explained it. That is the point that I raise. I am not doubting his statement, you understand; I am merely showing that it apparently is a new condition. It surely could not have existed at the time he made that other statement. And furthermore, his Exhibit 103 shows more loaded cars of the kind described going east through Ogden than there are similar loads coming west. I haven't heard any explanation of that. The only apparent explanation could be a very great excess of the opposite nature coming in through El Paso. This is about a quarter more of box and auto cars; leaving out coal and flat the excess is about 50 per cent. There are a few coal and flat cars coming into this exhibit. (4094.) Now to whatever extent those empty cars do come from California to Oregon to be loaded for eastward movement, they will surely continue to come when the Alturas line is built, and when the Crane line is built the same reason economically for transferring to Oregon will continue to exist, because it will be the nearest point where they can obtain loads. It will be more economical and more profitable for the Southern Pacific to send them up here to load than it will to haul them empty to either El Paso or Ogden and dispose of them. I can see no reason for any change in those conditions. That would be true if, as testified to by Mr. Burckhalter, the distance to El

2271 Paso is about the same as it is to Oregon. I would hold it would be true the empty haul would be the same in either direction, because at El Paso it would be disposed of so far as western division is concerned, whereas by taking it to Oregon it would get a load. But, as I understand his statement, it would be rather farther to El Paso from the center of gravity of these empty cars than it would be to Oregon.

Mr. McCULLOCH. I think, Mr. Commissioner, my impression is that Mr. Burckhalter was referring to Ogden as a point to get those empties back to their eastern owners rather than (4095) El Paso, when he was comparing the distance that would be involved on one hand in taking them up to Oregon for loading or taking them back empty through one of the eastern gateways and delivering them to their eastern connections.

Comr. McMANAMY. Very well. The record will show, but he was talking about Rock Island cars.

Exam. ROGERS. As I remember it, he was talking about the distance from Los Angeles to El Paso and Los Angeles to Oregon.

The WITNESS. Well, it must be that a great number of those cars are unloaded north of Los Angeles, although I believe he testified that Southern California was the chief point. Now to whatever extent those empty cars will continue to come from California in place of coming across from Ogden, my statement as to possible earnings will of course be reduced; that is, there will be no savings by the haul of the empty car that will continue to move as now. Our saving on the empty car mileage will be wiped out, of course, if all of those cars are to come from California. There will be no saving on empty backhaul, because there will be none.

2272 Mr. Burckhalter commented on my error in omitting the (4096) cost of the empty haul from Omaha, but I can't see where that comes in; if those cars are coming from California there is no occasion for considering any empty haul from Omaha either as a saving or expense. It does not enter into it. It would be a condition under which the Southern would take the entire burden of furnishing the empty car and the Union would get the load without any expense of the empty haul. So I want first to show what the effect on my figures would be if we assume the condition described by Mr. Burckhalter as completely covering the situation, that is, that all empties would come from California, no empty burden whatever on the Union Pacific. Now it is not of vital importance in the question, but in order to show a picture of relation of earnings to cost, approximately correct, I take 850 miles as the average haul of these empty cars from California to Eugene. It is 625 miles from Eugene and 978 miles from Los Angeles. I am taking the distance that is nearer the Los Angeles distance, applied a small amount—San Francisco is 625 miles from Eugene; Los Angeles is 978. Now on the basis of figures of empty haul, which are in (4097) my Exhibit 16, I find for those 850 miles cost for the empty haul at $73.45. Now from my own tables in Exhibit 16 I find that if I leave out refrigerator and stock cars I had for the first year of the new line, on the supposition that the Alturas line was built and that we had only the other traffic to consider, that there would be 17,535 cars east and 2,602 west; that is a percentage required for eastward movement, therefore, of 85 per cent. I therefore took 85 per cent of that $83.45, or $62.50, as the average cost of

the Southern Pacific on the empty haul for all the loading, and I substitute that for my former calculations of empty hauling as
2273 against the Southern Pacific, and eliminate entirely the cost of empties from Union Pacific movements. Then I repeat the calculations which are on page 117 in my Exhibit 16, on the establishment of suggested joint rates. I suppose I ought to read this. This is not being made an exhibit. (4098.)

Mr. McCULLOCH. I am going to offer the whole thing in the record, as soon as it is explained.

The WITNESS. Well, I treat it as before, finding the net earnings of the two carriers under the supposed conditions, and on the exchange at Ogden with haul via Alturas, and find the Southern on that making a net of $61.37 and the Union Pacific $81.70. Then, in order to protect the Southern, I conclude that it would need to have 36⅔ per cent of the joint rate, and proceed to apply that to these same calculations of car movement and earnings; finding, therefore, that the Southern Pacific on those cars destined to Omaha would have a reduction in its net of $8.50 on haul via Crane and the Union Pacific, an increase of $31.05. On those cars destined beyond Omaha, which is the bulk of the traffic and on which the Southern Pacific would, under the haul via Alturas and exchange at Ogden, make $31.62 and the Union Pacific $63.70, would, under those proposed divisions, be a net for the Southern Pacific of $33.62, which is $2.00 more than at Ogden and for the Union Pacific of $20.55. (4099.) Let me correct that: For the Union Pacific a net of $84.25, which is an increase in its net of $20.55. The number of cars moved to Omaha, sustaining a loss to the Southern Pacific of $8.50 each, would be exactly balanced by the larger number going beyond Omaha, and giving to the Southern Pacific an increased net of $2.00. I then revise the first part of my Table 21, page 141, of Exhibit 16, by
2274 the substitution of these reduced net earnings per car and find a reduction in those earnings of $161,795 for the first year. And for the fifth year a reduction of $236,007. Now these reductions would reduce the rate of return shown in my Exhibit 107 on page 8 for the first year from 6 per cent to 4.4 per cent, and that of the fifth year from 10.4 to 8 per cent, and other years in proportion.

Right at that point I would like to digress a moment, because of a question which the examiner has asked several times about the fairness of these divisions, and point out a difficulty that comes there in determining that. You will note here that in these figures I have $62.50 to be charged as a cost figure for the Southern Pacific, giving it on that basis a less net earning out of traffic (4100) which it originates than falls to the Union Pacific on the division, but the question would arise there, and I do not know how it would be answered, whether the Southern Pacific's cost should be considered as beginning at the time it took the empty car from the unload point in California, or from the time the empty car was delivered in Oregon, because if it did not send it to Oregon to be loaded it would have to move it to some other point somewhere near the same distance, pos-

sibly a greater distance, without any revenue whatever. Now, that would be a question, I think, that would be difficult to determine, whether all or any part, or what part, of that empty car movement ought justly to be attached to that cost.

The question as to whether the transportation rate under which that car moves to California contemplated the return empty haul of that car could not be considered alone. The whole thing would have to be taken into account. It would be a difficult matter to determine.

On the one supposition the Southern Pacific is getting the
2275 short end of it; on the other it would get the long end of it by about an equal amount.

Now as regards Mr. Burckhalter's statement as to the empty car movements, I find his Exhibit 103 showing 7,000 empty cars, in round numbers, suitable for this loading west through (4101) Ogden in 1926, and in his oral testimony he said that about 8,600 such cars moved west in the same year through El Paso. Now that together is more than the entire first year requirements of empties for the Oregon cross-State line. Now it seems to me beyond question that a great part at least of those empties would not have been hauled west if it had not been for the needs of Oregon traffic. I can't determine whether it would be all, or how much; I haven't any data at all, except what Mr. Burckhalter gives, and it is difficult to interpret another man's statements as regards that; but I can't but think that certainly that condition must, in a considerable degree, modify his statement that all the empties would come from California, by mere process of taking the unloads. So the only conclusion I can come to is that the true statement is somewhere between the figures which I have presented and those which he has presented as a criticism of mine.

Exam. ROGERS. Going back to your comment a moment ago about the fairness of divisions, would that not also involve the question, Mr. Newell, as to whether in fixing the rate on these commodities from western Oregon east there was taken into consideration where the Southern Pacific would get its empties and the condition under which it would get its empties to move those commodities?

A. If that were the only carrier and the only commodity, undoubtedly that would have to be taken into account. But as a
(4102) matter of fact, those rates are established all along the coast, taking in all the carriers, and I think no such condition
2276 exists elsewhere, and this being the long route as compared to the others. I suppose it to be the fact that the rates are established on the consideration of the other carriers rather than of this one and that these would have to correspond. We would have to determine the basis upon which the transportation rate is fixed before we could really say what it would be with positiveness. But surely the rates must take into account the average movement of empty cars, because it is a large part of the cost, against which the carriers could not live, if that was not taken into account. If the rate were established by the Southern Pacific, or established by somebody for the Southern Pacific movement, and then the rates via the other car-

riers simply met that rate, then the Southern Pacific—its conditions would be the controlling conditions. Of course, this condition always exists: That a carrier makes much more money on a car of freight which can be loaded in a car which has come to it with a load, than it does where it has to haul an empty the whole distance to get the load. But the normal relation of those two must be taken into (4103) account as a cost element. That concludes the comment I had to make on Mr. Burckhalter's testimony.

Mr. McCULLOCH. Well now, you have some comments on Mr. Day's testimony. I shall offer that statement as an exhibit a little later, because I have previously had some other exhibits marked for identification.

(Said statement, consisting of four sheets, was thereupon marked "Complainant's Exhibit No. 129, Witness Newell.")

WITNESS. I had some comments on Mr. Day's testimony. The difference between Mr. Day and myself in these matters is chiefly the question of the point of view. He is dealing with them, as I understand, in his work, from more a temporary point of view
2277 than mine, or one that does not attempt to go so far into the future. The comparisons that he spoke of were chiefly those where he observed monthly (4104) variations in expenses. I am really surprised to find that he was able to trace the effect of fluctuations in traffic so closely as he testified that he could. I mean so minutely; because it has been my own assumption that those minor fluctuations in traffic would probably make themselves felt in expenses only to a very small degree, because I think this is always true: That with any force of men if there is a small increase in the amount of business coming in, that those men, if they are loyal to their employer, as railroad men generally are to their employer; and being loyal to their employer they work a little bit harder and push things along a little bit more efficiently and put a little more force into their work generally, feeling that business is good and that they ought to do it; and, as a consequence, I would not expect that cost would run up immediately in proportion to traffic. On the other hand, if business is falling off, men are very apt to feel perhaps there are going to be some men laid off and they had better slack up a little bit and make it necessary to keep the same force on there. The same considerations operate just in the opposite directions. So it seems to me perfectly natural that minor variations of traffic will not make themselves immediately felt in expenses. (4105.) But neither one of those conditions could exist a very great length of time. No management would permit its men to be slacking off because business was falling off, and pretty soon it would come to the other way about; if anything, where they would begin to lay men off, to reduce the force and demand more activity out of their men.

On the other hand, if the business continues to increase and it appears to be a permanent change, the men themselves are

2278 not going to consent to do more labor than they feel just. They fall back—the men come back in both cases to the normal condition of activity and energy on the part of the force, and in relation to its efficiency, management, and so forth. So that then I consider that the effect of change of traffic in volume of traffic itself would be truly felt, and for that reason I have never thought any accurate comparisons for my purposes, where I want to consider this thing from a rate-making standpoint, could be of any value, if they were taken over brief periods of time or for minor small differences in volume and density of traffic. I think it requires comparison with conditions which are quite widely different as to variations in traffic so as to get rid of the effect of these minor variations, which will exist always and on any road. (4106.)

Mr. Day spoke about the use of the Railroad Administration's rule for the effect of traffic on various expenses. Now it is some years since I saw that rule, but I studied it at the time to see if it had any light on the subject from my standpoint. I concluded that it did not. While I have no criticism of it at all for the purpose for which it was established, it seems all right, and as I understand it was necessary in settlements of that nature that there be a rate established which might apply to every carrier so that there need be no disputes as to the manner of its application, but I think it is quite obvious that the percentage of indirect expense in itself must vary with the volume of the traffic. Suppose, just as an illustration, you had your maintenance of way; suppose you had two roads practically identical in their character, except in their volume of traffic; suppose the smaller one has a maintenance expense, let us

2279 say, of $1,500 a mile, and we conclude from examination of it that $1,000 of that is a direct expense and $500 of it is indirect, then if the other road similarly conditioned has three times as much traffic, you would expect to find that $500 figure multiplied by three, giving you $1,500, and the (4107) $1,000 figure remaining is constant as not affected by the traffic. So that you would then have for the larger road a total of $2,500, of which 60 per cent is direct, while in the smaller road you would have only 33⅓—you have only 33⅓ per cent direct, assuming that the indirect is exactly the same. Now that makes it improper, for the purpose of rate considerations, to apply a constant ration of direct or indirect to any account, regardless of the traffic of the road carrying it. Regardless of the traffic of that road. That must be taken into account in any rule of that nature.

Exam. ROGERS. But if, on the other hand, Mr. Newell, quite aside from this case, if you were considering the rate structure, say, to apply to all carriers west of the Mississippi River, then do you think it would be proper to apply some general figure, as, say, a third of the maintenance of way and structural expenses?

A. I think the proper way to do it would be to take varying roads, which might be taken as a fair cross section of all of the roads, and

make such calculations on more than one of them and consider the results obtained. That might be a third, it might be a half. I could not answer what it would be. That would bring it more in line with the (4108) Railroad Administration method. As Mr. Day referred to it. But, as I say, it was necessary to have such a rule, I think it must have been too liberal in some cases and not liberal enough in some others. Mr. Day commented on my
2280 coal cost, fuel cost, rather, on the Southern Pacific. I would like to go back and show in regard to that, that if there was any error in my figures it was not in principle but merely in the use of facts, and I think the facts as I found them, unless they are contradicted by something else, bear me out approximately, at least, in the figures which I used. (4109.)

On page 61 of my Exhibit 16, I compare the cost of fuel, Oregon-Washington Railroad & Navigation Company and Southern Pacific, both on the Oregon lines, and I found that train fuel per thousand gross ton miles on the Oregon-Washington Railroad & Navigation Company in Oregon cost 53.9 cents, while on the Southern Pacific it cost 73.2 cents. It is not six tenths, it is 73.2. I corrected that because of the difference in grades on the roads in this way, that if the Southern Pacific lines in Oregon had exactly the same resistance to be overcome, as on the Oregon-Washington Railroad & Navigation Company, the relative cost would have been 53.9 for the Oregon-Washington Railroad and Navigation Company and 70.6 for the Southern Pacific. That is, the Southern Pacific fuel on that basis cost per thousand gross ton miles nearly 30 per cent more than the O.-W. Now, it is true that it has more branch lines than the Oregon-Washington Railroad & Navigation Company. I found that the branch line fuel cost on the O.-W. whole system—not Oregon alone—was about 20 per cent of the entire fuel bill, while on the Short Line it was a little less. I don't know what it is on the Southern Pacific, but in any of these carriers the main line fuel bill very much outweighs the (4110) other, so that I think that I was certainly, to all appearances, at least, very liberal to the Southern Pacific in assuming as I did that the fuel cost was not greater than that of the O.-W., and it is that fuel cost entering into my unit cost of resistance of which Mr. Dey was speaking, and that par-
2281 ticular figure, the highest that I used anywhere, was applied only in Oregon. I didn't apply that figure in California or Nevada for Southern Pacific movement.

As to Mr. Day thinking that because I included the branch line fuel cost in computing the figure to be used on the main line, and because the Southern Pacific branch lines constituted the larger proportion of the total mileage, that threw it up, he is mistaken about that. On the Oregon-Washingon Railroad & Navigation Company I made a reduction because of the branch line fuel bill to bring it into line with main line fuel cost for similar performance. Now, when

I came to the Southern Pacific I wasn't making the same detailed analysis of its costs as the O.-W., but I took the unit of the O.-W. which had just been reduced and still further reduced it arbitrarily—or not reduced it, but I mean took the higher cost, disregarded the higher cost, apparently, on the Southern Pacific for branch line and main line together, and used the O.-W. main line figure for the Southern Pacific main line. Now, it is true that (4111) might not be quite sufficient reduction, it might be that it would be a little less, because of the relation between the branch line and the main line mileage; on the Southern Pacific, there being more branch line.

Mr. SPENCER. Is that true as to the system—the Southern Pacific lines in Oregon have a larger per centage of branch line mileage, when you take into consideration the two main line routes from Eugene to California, than the Oregon-Washington Railroad & Navigation Company has if the entire Oregon-Washington Railroad & Navigation Company system is considered?

A. No; I think not. My comparison was with the Oregon-Washington Railroad & Navigation Company in Oregon, which is about 40 per cent main line. In applying my figures to the cross-State line I considered it main line. On pages 62 and 63, of
2282 Exhibit 16—I didn't apply those figures to the cross-State line. Mr. Day's comment was on my figures applied to the Southern Pacific. I modified my unit costs as shown in detail on these two pages of Exhibit 16 to suit, as I considered it (4112), the varying conditions of the different districts over which I was calculating costs. I considered the cross-State line as one, the Southern Pacific lines in Oregon, as another, the Southern Pacific lines from the Oregon boundary to Ogden as another, the Short Line and Union Pacific I took as the same, applied correspondingly different unit costs, after making allowances, as stated here, for differing conditions. Those conditions aren't very great, but they expressly take into account this difference in fuel cost as indicated by the cost per thousand gross ton miles of these different carriers. If there was any error in that it was an error in interpretation of facts rather than the principal of the application here.

I assumed that the cost of fuel on the Southern Pacific was the O.-W. R. & N.'s main line average cost for Southern Pacific main line in Oregon.

Mr. Day was speaking particularly about the hills. He made the remark that he thought I hadn't allowed sufficient for cost of operation on hills. Well, now, there are only two important hills in this connection at all—one is that from Eugene to Crescent Lake, and the other over the Sierra-Nevada Mountains in California. Now, the latter isn't important in this contention, because the real contion is, of course, on the (4113) comparison with the Alturas line, of which that is no part; and as far as the hill from Eugene to Crescent Lake is concerned it is common to both routes, and, therefore, its cost is of no importance, other than merely keeping in mind

the relation between the total cost and rates, and is put in
2283 only for that purpose. As far as these comparisons are concerned, if I took it twice what I did or half what I did it would have no effect on the results, it would only make my relation between total cost and total earnings look out of place, or be out of place.

Mr. Day spoke about my percentage of direct cost of maintenance of equipment being too great, taking it at 100 per cent. I think he said that it ought to be about 80—I am not certain what figure he used, but quite a little less, in any case, than I did. Now, he may be right from his standpoint—that is to say, that, assuming that here is your equipment, perhaps an increase in business would reflect only that additional maintenance on that equipment, but I am looking at it this way, and I think for my purposes it is correct, while his is correct for his. I say that equipment would not be there at all if it were not for the growth of business to the point it has reached. I think the management of the company is carefully keeping that equipment in proportion to its volume of business. If its traffic increases, it will make a corresponding increase in its equipment. If the business falls off, they will, as soon as they are satisfied that it is a permanent falling off, they (4114) will undoubtedly reduce that equipment, if such a thing were to happen. Now, if the entire investment in equipment is due to the traffic and is variable with it, then surely the maintenance itself must likewise be. That is my reasoning on the subject, my reason for taking that as 100 per cent.

Exam. ROGERS. Let's see if I understand that, now, I understand Mr. Dey's premise was that the equipment was going to remain the same in either case, that is, the number of units, and so on, the total tractive power on the lines, than according to the number of tons which that equipment hauls 80 per cent of the expense would vary with the——

A. Something like that. I think that is a very reasonable
2284 estimate. My assumption is that I am talking about the total equipment on the line, and the total equipment on the line will vary with the traffic moved. Not, of course, immediately, but I am not looking over it for such a length of time as you are taking into account when you are making rates, but that if the volume of equipment itself varies, necessarily all the expenses connected with it must likewise vary in proportion to traffic.

When I say "such length of time as I would take into account in making of rates" (4115) I mean time, at least, measured in years. I don't know exactly how many years it would be, but I wouldn't suppose that even a change expected to last only one year would be affected in rates, although it might. That would be variable with differing commodities, no doubt.

Exam. ROGERS. Well, Mr. Newell, on your maintenance of equipment, suppose that you have 1,000 locomotives on the line, and those

1,000 locomotives are sufficient to handle the business, then business increases until you have 1,100; now, is it your thought that the maintenance of equipment expenses would go up at the ratio of 1,100 to 1,000?

A. Probably, yes. Assuming all other conditions to be the same, of course. I am trying to leave out of consideration anything like a difference in efficiency—better engines, or management that gets more work out of each engine; that is a question of efficiency.

Exam. ROGERS. But take the question of ship buildings, might you not have a case where the shops were adequate to take care of the maintenance of equipment on 1,100 engines, without any increase in facilities? (4116.)

A. Quite true as regards the buildings. Now, it might be true, also, as regards the shop equipment. It might be true as to some superintendence. As to superintendents of motive power and
2285 master mechanic, it isn't probable that the superintendent of motive power woud get any bigger salary when he had 1,100 locomotives than when he had 1,000, still he would be nearer the time when he would get his pay raised.

Exam. ROGERS. Or that there would be any more superintendents of motive power?

A. Yes; but suppose that increased up to the point where they do have to put on more shop equipment, all at once there would be a big jump there—not a large jump but still a proportionate jump, in that one item. Now, I think that ought to be considered over a natural, slow growth, rather than wait for the particular year when it would actually occur, which no one could calculate beforehand.

As to these charts. These were made primarily for my own study. (4117.) They were not intended to be used as exhibits for some considerable time, but I thought it would be well to have some of them ready in case any discussion of this kind arose, and I had some photostats made of the few that I had and those are what I have here as exhibits. They are merely pictures. I haven't preserved the calculations from which they were made, otherwise I would reserve those, because they would be made the basis for calculation. These are not intended for anything more than illustrations, but in this Exhibit 119 there is the study of relation of traffic to operating expenses for the year 1915. (Ex. 119.) In any discussion of that kind it is a difficult matter to determine exactly what unit is to measure your volume of traffic. Different roads have different proportions, of course, of different kinds of traffic, but I hit upon this as at least a fairly close approximation. I found that on some roads of which I had the figures—the Southern Pacific, as I recollect, being one of them—that, approximately, the
2286 operating expenses charged off to passenger amounted to about 3.7 times as much per passenger mile as those freight expenses when divided among the net ton miles, so for this purpose I as-

sumed that one passenger mile meant as much traffic as 3.7 net ton miles, and I therefore (4118) took the net ton miles of the roads under consideration and the passenger miles, multiplying the latter by 3.7, and calling the total a traffic mile, then I divided that by the miles of road and made my chart accordingly.

The figures on the horizontal line at the bottom of the exhibit indicate hundreds of thousands of traffic miles per mile of road. Those vertical figures, the figures in the vertical column, are the thousands of dollars of operating expense per mile of road, and the chart indicates very clearly how rapidly operating expenses increase as its traffic, measured by this unit. The increase is not as rapid on the roads in going from a road of small traffic to one a little larger, but if you observe the ratio indicated by the straight line, which has been merely drawn in here by eye as being fairly indicative in the course of all of these dots, it increases in the upper part of the chart fully as fast as the traffic does, showing a tendency to reach a point in the roads of larger traffic where the operating expenses will be in practically direct proportion to the volume of traffic itself.

Now, the next exhibit, 120, takes the same traffic and simply uses as the measure of traffic the operating revenues per mile of main track and the operating expenses per mile of main track, and the uniformity of these is even more marked on this chart than on the preceding one. The dots all fall in (4119) closer together. As I recall, there are 30 roads used here, and those 30 are the same which are used in the tables in the appendix of my report on the
2287 grain case which was introduced here as 16-A in this case. And those roads I selected as being fairly typical roads, with no extraordinary conditions, such as a great preponderance of freight traffic or of passenger traffic. I made similar charts for 1916, 1917, and 1924, and I think a comparison of them and observation of how nearly alike they all are is significant of a uniformity of this condition extending over these four years.

As to 125 and 126, for the year 1924, and as to what the 125 and 126 indicate as to the relation of traffic to operating expense for the year 1924 as compared with the first two charts for the year 1915, there is no difference of any great extent. It is quite significant that the operating expenses are much larger, so that the line stands up more nearly vertical. (4120.) But that merely indicates a larger expense per mile. The relation of the traffic to operating expense shows the same, or approximately the same, in '24 as it did in '15 and subsequent years. I don't think that anyone could tell which of these was likely to be in a given year rather than in another year if the dates were covered up.

Explaining 127 and 128: This is a study of the same thing from the standpoint of operating ratio. It seems to me an obvious conclusion that if expenses do not increase pretty closely in proportion to traffic, that then the roads of the heavier traffic must have very

much better operating ratios than those of the small traffic, but these charts indicate that such a condition does not exist. If you will note that those at the left-hand side of the chart where the operating revenues per mile of road are much less than at the right, that there are many roads in that class having better operating ratios than such roads as the Pennsylvania, the Lackawanna, and the Reading, which are of the very highest density of traffic, as measured in this chart, high operating revenues. Likewise,
2288 also, there are at the left-hand roads of small traffic having very much worse operating revenues, as well, but on the average it seems from these charts that it makes not much difference what the (4121) volume of traffic is as to what the operating ratio will be—that is, that roads of large traffic have just about the same operating ratios as those of small traffic. I can not conclude from that otherwise than that the operating expenses must increase normally in a very close relation to that of the traffic, and I, therefore, think that Mr. Day is seriously wrong when he proposes to cut my figure for the O. W. of about 84 per cent direct, to cut it down by a third. I don't think that I am wrong in that to any substantial extent. I think the operating expenses are direct, very closely, in proportion as I have found them. I have made similar studies before this. My study of this matter has not been constant, but it has extended over a period of some 10 years and in different cases, this is the third time that such a study has been submitted before the Interstate Commerce Commission, that is, counting the grain rate case just preceding this as another one, but a similar study was first made in 1919 in the Columbia River differential case, and was reviewed again in 1924 at Walla Walla, with no serious attack on these figures. I made such a study on the Grand Trunk in Canada, and at that time there were on our staff some very able railroad engineers (4122), and I will say this, that each of them when I consulted him declared at once that my direct ratios were too large, wouldn't believe it, but after we had sat down and studied the thing, and I had explained my reasons and gone over it in detail they came to agree with me that I was correct—that is, in estimating the direct proportions of operating expenses. And further, I wrote an account of that study for the American Society of Civil Engineers in 1923, and they gave me one of their annual prizes for the best paper on transportation of that year.
2289 I think that subjected it to a pretty wide range of observation and criticism. That was in the annual proceedings of the society for 1923. Very glad to give you a copy, if it is of interest to you.

I have also made other studies the results of which I have charted along this same line, but which I haven't prepared for introduction (4123) as exhibits, that confirm those conclusions. These are with reference to single accounts. Some of them are, I think, not of any

importance here, and if they are not for exhibits here I will be glad to pass them around, if they are of any interest at all. There is a study on relation of traffic to roadway maintenance—not track-laying and surfacing, but roadway maintenance—and I have such for several different years. I have them here for relation of maintenance to water stations and traffic. This is based on 16 western roads which are named in this appendix to Exhibit 16. Now I am not talking about exhibits, but about these charts, which I am merely passing around that you might look at them. They could be prepared for exhibits, but I couldn't get them prepared in time for today, because I thought this matter was not coming up at all and didn't make any preparation for it. (4124.) Should I say anything about it? It has to do with relation of general expense and traffic.

Comr. McMANAMY. I guess the charts will not be particularly helpful to this case.

WITNESS. I have made numerous studies in the past of the relation of traffic to various accounts or items of operating expenses on various railroads. (4125.) I have charted the results of many of them. The study that was incorporated in Exhibit 16 in this case and in Exhibits 119 to 128, marked for identification, was made with the results of such other studies in my mind, and using those
2290 other studies, having them before me, and considering all the figures and estimates which I had previously used. I have completed such explanation as I wanted to give of Exhibits 119 to 128.

Exam. ROGERS. Mr. Newell, I was just wondering about one thing in connection with our maintenance of equipment, if we didn't have here a little reverse situation—of course, all this is hurried consideration; there may not be anything to it—but if the Southern Pacific had all the facilities in men, machinery, and investment, and so on—of course, some of them may be outside of the maintenance of equipment block (4126)—but if it has all those things to maintain its present equipment, and by reason of diverting this traffic some of its present equipment is made unnecessary, won't some of those items continue to go on as an expense whether this equipment is used or not?

A. I presume they will, and be some loss to the company in consequence until their traffic grows to a point to take that up and utilize it. I don't regard this as any—it certainly isn't any large proportion—of their total traffic, but to whatever extent that would operate it would, of course, constitute some loss to that carrier. I hardly think that would influence our 100 per cent variation with maintenance of equipment. That would be a temporary factor that might be sufficient to take it into account. It wouldn't influence the general principle of the increase of that cost in proportion to the

increase of business. You have here a case where you are going in the other direction, and it doesn't respond, it is true, quite as quickly there, and in some respects, of course, it may involve investment that can't be got rid of, but, in general, equipment—it would be possible either to dispose of it, or the increase of business on
2291 this road—which it is increasing—business would soon require that same equipment, find use for it. That would only be a temporary condition, I think. (4127.)

(The papers heretofore marked for identification "Complainant's Exhibits Nos. 119 to 129, both inclusive, Witness Newell," were thereupon received in evidence.)

Cross-examination:

Exhibits 127 and 128, which are the last two of the charts, are designed to show the relation between the density of traffic and the operating ratio. It is true that a railroad that is largely handling a low-grade commodity taking rates with a low margin of profit might have very great density of traffic and a high operating ratio that would present an entirely different situation, because of the low net earnings, as compared with a road that had a very much lighter density of traffic, operating under a rate structure where the earnings carried a very considerable profit. (4128.) There is not an element there that should be supplied in order to make a chart of this kind of any value. It isn't without value because it doesn't have value. If you were to undertake to compare any one of the roads in this chart with any other one you would have to take those things into account. I think it has value; when you take, as this does, all the Class I roads of the country and put them into a chart, this has some significance. I don't mean that one could determine from this what the particular ratio is, but I think it is indicative of a very close relationship between the total operating expense and the total amount of traffic. That is the only purpose for which it is introduced.

As to my reference to Mr. C. E. Day's testimony, stating that he took into consideration minor fluctuations from month to month, in the particular instances he cited, that is what he did.
2292 I think Mr. Day stated those were minor fluctuations. I so understood him. He didn't speak of them as indicating very large differences. They were merely the seasonal differences, as I understood him, that occur—— (4129.)

Q. Well, don't you know that there are very marked fluctuations between brief periods?

A. I know that they are minor at least from the standpoint of time.

Q. (By Mr. SPENCER.) Mr. Newell, your Exhibit 16, where you are analyzing operations via Roseville and via the proposed cross-State line, proposes division to the Southern Pacific on the eastbound business, going east of Granger, I assume, of 17 per cent.

A. That was for that first three-year period, yes. When the Alturas line came in I increased it to 27 per cent. By Exhibit 129 I increase it to between 36 and 37 per cent. That is to apply on all western Oregon business destined east.

Q. And yet, as I understand you, you say that the present division of 25 per cent accorded to the Southern Pacific lines on business moving through the Portland gateway is so (4130) excessive and unreasonable that it isn't attractive to the Oregon-Washington Railroad & Navigation Company and Union Pacific lines?

A. That I haven't had an opportunity to consider—at least, I hadn't thought of it since this matter of Mr. Burckhalter's testimony came in. I don't know whether his statements as regards the empties will be applicable there. Perhaps it would. That, of course, would change that consideration, and I haven't attempted to work that out. I don't know what the condition would be if we are to suppose that the Southern Pacific takes on the burden of the empty car haul and leaves the Union without any; that would change that situation.

Q. Well, you know, as a matter of observation and expe-
2293 rience over a long number of years, and from your own relations with the O. R. & N. in the early days when it had all of this western Oregon business eastbound, that the Union Pacific furnished a big end of the cars through the Portland gateway, and that is the way it would be operated, wouldn't it?

A. Well, I suppose that is true. I have no knowledge of it myself.

Q. You don't assume for one moment that if the Southern Pacific were turning over western Oregon business in the volume your study contemplates that the Southern Pacific would bring in all of the empty cars to move the business, short hauling itself, do you? They would call on the Union Pacific to furnish the cars (4131) through the Portland gateway, wouldn't they?

A. Well, I assume that is the fact. I thought you were asking the question now in view of the fact that Mr. Burckhalter testified——

Q. No; I am just wanting to call your attention to these divisions, which you more than double, from your 17 per cent up to your 37 per cent——

A. Well, that is for another reason entirely, there.

Q. Well, I know, but it is the same—whatever the reasons may be, the financial distribution and the effect on the carriers involved would be progressively to the advantage of one and to the disadvantage of the other, whether you increase them or decrease them; that is true, isn't it? If you increase the division to the Southern Pacific on the traffic, the result would be to the advantage of the Southern Pacific, wouldn't it? That is what it is done for.

A. Sure. In this particular case. I have increased it in accordance with a statement which if true would show a larger burden
of cost to be borne by the Southern Pacific, that is, the
2294 entirely empty car haul.

Q. But if you increased them to any such proportion as that, wouldn't it obviously induce the Union Pacific system lines to take it through the Portland gateway?

A. I don't know what the reason is for the Portland situation. Now, as far as Mr. Burckhalter's statement is concerned, I (4132) haven't attempted a calculation to see what effect that would have. When I made the other statement it was the expectation that the burden of producing empty cars would be borne as much by the Union as by the Southern. That would be the ordinary treatment as between the carriers. Now, if that is to be introduced there and the Southern Pacific is to bear on the exchange at Portland the entire cost of furnishing the empties, leaving no such burden on the Union, that changes the situation. I am not sure how that would stand until I would try to work that out.

Q. Well, the furnishing of cars by a carrier where it takes all the business by its long haul, even to the Southern Pacific in this instance from Portland and from north and west of Portland, wouldn't be a measure to go by if the traffic was to be diverted to another carrier which was to participate in the haul, would it? If the Union Pacific was brought into the operation and would take this traffic, by every precedent and experience it would be compelled to furnish its quota of cars, wouldn't it?

A. That was my assumption, yes. That is my assumption in the first place.

Exam. ROGERS. Then if the Union Pacific brought the cars (4133) in, and instead of utilizing the empty cars in Oregon
2295 Southern Pacific was compelled to haul them back, wouldn't that be another consideration in calculating a saving to the Union Pacific?

A. Yes; if that arose out of it, if that was made necessary by this, but I take it for granted that the two carriers would meet each other on mutually beneficial terms and take account of that situation. It would be foolish to compel the Union to haul empty cars out here if the Southern at the same time could furnish them at less cost. That would come back to my exhibits put in this morning; if that be the true picture of the thing, it is on that basis that the whole matter should be considered, if that is a permanent situation.

Exam. ROGERS. Now, if it goes to the relation of the expense you talk about if the Union Pacific furnish the cars, then in calculating the saving to the Southern Pacific on the basis that the Union Pacific is bring in the cars, wouldn't you have to give consideration to this empties proposition down in California?

A. You would, yes. (4134.)

Colloquy

Mr. ELLIS. We have no more witnesses. We have prepared the data introduced by Mr. Wiggins in the form that Examiner Rogers suggested, merely compiling it in the three groups by years as the

examiner suggested the other day, but they are not completely typed, they are in the course of typing now, and we would like the privilege of furnishing those for the record. There is no new information—simply put together in slightly different form. That is the tonnage and revenue estimates used by Mr. Wiggins, recompiled along the lines of the suggestion of Examiner Rogers, in three groups—one the traffic to and from the central Oregon territory, one the Idaho traffic, and one the traffic to and from western Oregon. The typing will be completed probably within the next hour.

2296 Mr. SPENCER. Well, as far as we are concerned, if you (4135) don't have the exhibits they can be given exhibit numbers now and furnished later.

(Said statement was thereupon received in evidence marked "Complainant's Exhibit No. 130, Witness Wiggins.")

Mr. ELLIS. We desire to introduce at this time by reference Exhibit No. 50 in docket 14392, pages 989 to 994, inclusive, which is Mr. George W. Buck's estimate of cost of constructing the cross-State line as introduced at that time, together with his testimony, pages 989 to 994, inclusive, in explanation of that estimate. (4136.)

Mr. ELLIS. I would like, also, to introduce the testimony of A. R. Olsen in docket 14392, which embraces pages 335 to 374, inclusive. The carriers have introduced a part of this and I merely want the entire testimony in the record.

Comr. MCMANAMY. That will be received.

Mr. ELLIS. I also desire to introduce as an exhibit a pamphlet published by the Chicago, Burlington & Quincy Railroad, Great Northern Railway, and Northern Pacific Railway, entitled "Timber Billions of the Pacific Northwest." I have been (4137) unable to get extra copies of these, although I have made every opportunity to get them from every available source around Portland during the past 10 days.

Comr. MCMANAMY. What is the purpose of that, Mr. Ellis?

Mr. ELLIS. The purpose is to call attention to the viewpoint of the carriers and their beliefs and their statements as to the——

Comr. MCMANAMY. You are not going to try to find these carriers by something the Burlington put out, are you?

2297 Mr. ELLIS. The Great Northern and Northern Pacific are parties to this case, and this contains information directly in rebuttal to the claims of carriers in their testimony here as to what there was in the way of resources in the State of Oregon.

Mr. SPENCER. Well, I think that if we are to be bound by anything that the other railroads have published, why, we should have opportunity to examine them with respect to it—a lot of flamboyant literature here that——

Mr. ELLIS. I intend to be entirely impartial, Mr. Spencer—I have some of the Union Pacific here.

Mr. DEY. Well, what testimony of ours, of the defendants, do you claim to impeach by these pamphlets?

Mr. SPENCER. Wherein is this rebuttal, in other words?

Mr. ELLIS. I wouldn't call this impeaching testimony (4138), necessarily. It is, though, rebuttal in that it contains a great deal of information on the timber stands of the Pacific Northwest and of the entire United States, as adopted and published by the carriers themselves, and it is circulated and broadcast throughout the country.

Mr. MCCULLOCH. Not only that, but it does contain information put out over the names of two of the defendants in this case directly contradicting evidence that has been offered by the defendants here to the effect that the production of lumber in the Pacific Northwest as compared with the production of lumber in other sections of the United States is not increasing, and will not increase, within a reasonable period of time, as we have claimed, in order to supply the consumption demands in the United States, and it is strictly rebuttal in that sense.

Mr. SPENCER. It should be called to the attention of the roads purporting to be authors of the publication, and it hasn't
2298 been called to the attention of any of these defendants, and it isn't established as authoritative by any witness, and it certainly hasn't any place here as substantive testimony, or as rebuttal testimony.

Comr. MCMANAMY. What do the pamphlets consist of, Mr. Ellis? That is; who prepared them? Whose are they?

Mr. ELLIS. The one I have referred to is prepared by the Chicago, Burlington and Quincy, the Great Northern Railway Company, and the Northern Pacific. (4139.)

Mr. MCCULLOCH. Let the commissioner see it.

(Mr. Ellis here handed said pamphlet to Commissioner McManamy.)

Mr. SPENCER. As bad as the Saturday Evening Post. The dates seem to be 1923. I don't know——

Mr. DEY. A lot of water over the dam since then.

Comr. MCMANAMY. I don't see much difference between this and the opinions of chambers and commerce and others that have been received in evidence. This will be received.

(Said pamphlet was thereupon received in evidence, marked "Complainant's Exhibit No. 131.")

Mr. ELLIS. I also offer in evidence at this time pamphlet entitled "Oregon for the Settler, Southern Pacific," which contains an elaborate summary of the resources of the State of Oregon, and describes Oregon as "the one uncut melon of the western world."

Comr. MCMANAMY. Mr. Ellis, we can not accept as evidence and as exhibits in this case the various advertising pamphlets that may be gotten out by these carriers over a long period of time. I am trying to be liberal in this respect.

Mr. SPENCER. It seems to me that is just what is being accomplished right now in a very effective way, Mr. Commissioner.

2299 Exam. ROGERS. Well, do the carriers dispute what is in these pamphlets? Take, for instance, this, the Southern Pacific's, do you dispute the correctness of that, Mr. Dey? (4140.)

Mr. DEY. I don't know what's in it, what data is there, or what the source of it is.

Exam. ROGERS. Well, it was put out by the Southern Pacific. Do you dispute the correctness of it at the time it was put out? If you do, why, what kind of information are you handing out to the public?

Mr. DAY. Whoever prepared it may have had erroneous data. It may have been a matter of opinion by some advertising man in the passenger department. We couldn't be bound by that, in the event he was in error.

Mr. MCCULLOCH. Well, certainly on the principle that admissions against interest are always admissible it seems to me pamphlets of this kind are admissible, and it ought not to be assumed that the defendants in this case will represent one thing to the public and another thing to the Interstate Commerce Commission.

Mr. SPENCER. Well, you are doing the same thing down here with the Portland Chamber of Commerce—telling the world to keep out of the desert country here, and then having them come up here and picture it as a paradise of production.

Exam. ROGERS. Well, what was done with that information of the chamber of commerce? Wasn't it admitted?

Mr. SPENCER. It was current data gotten out and circulated and put in at an appropriate time, but here is data here with respect to the entire Oregon country published by different carriers, bearing no dates as to time, except the first one (4141) offered appearing under date of 1923.

Mr. MCCULLOCH. However, they are being currently distributed to the public.

2300 Mr. SPENCER. No one here to analyze——

Mr. MCCULLOCH. I would like to suggest that the one just offered was offered and received in the previous hearing in this case. Its accuracy and reliability is vouched for by the president of the Oregon Agricultural College, W. J. Kerr.

Mr. SPENCER. In the previous case?

Mr. MCCULLOCH. Yes.

Comr. MCMANAMY. It will be received.

(Said pamphlet was thereupon received in evidence, marked "Complainant's Exhibit No. 132.")

Mr. ELLIS. I would like to introduce a similar compilation entitled "Oregon," issued by the agricultural department, Union Pacific system, at Omaha, Nebraska.

Comr. MCMANAMY. Is there a date?

Mr. MCCULLOCH. I don't think there is, Mr. Commissioner, but this pamphlet, I know, is being currently distributed to the public.

Comr. McMANAMY. It will be received.

(Said pamphlet was thereupon received in evidence (4142), marked "Complainant's Exhibit No. 133.")

Mr. ELLIS. I also introduce a "Map of Oregon, with a brief description of its resources, development, topography, and climate," published by the Southern Pacific Company. I find no date, except that it is marked "Copyright, 1923, by Southern Pacific Company."

(Said map was thereupon received in evidence and marked "Complainant's Exhibit No. 134.")

Mr. ELLIS. That concludes our case.

Mr. DEY. Now, Mr. Commissioner, the exhibit that I mentioned at the close of the hearing yesterday I now ask to introduce as a part of Mr. Mulchay's testimony. It requires no explanation.

(Said statement was thereupon received in evidence, marked "Defendant's Exhibit 135, Witness Mulchay.")

2301 Comr. McMANAMY. I would like to ask Mr. Mulchay one question.

J. H. MULCAHY was thereupon recalled as a witness, and (4143), having previously been duly sworn, testified as follows:

I am familiar with the divisions received on broccoli shipped through the Portland gateway. It represents the same percentage of through rates that divisions on other commodities receive, 30 per cent—30 per cent of the through rate or proportion of the through rate accruing west of the Missouri River. The 25 per cent that has been mentioned applies to lumber, 30 per cent applies to other traffic on the main line, and 40 per cent on the branches. The local rate is the maximum on everything except lumber. We have never given any consideration to which way the Southern Pacific got the most money finally out of this broccoli, whether it was through Portland or through Roseville. (4144.) Because we take it in the general, every-day business. We don't attempt to segregate any business.

As to whether I ever expressed myself as to whether we could have made more money for the Southern Pacific taking it through Portland than through Roseville, I don't know that I ever have, in the sense of making more money by carrying it by Portland than via Roseville, in that sense.

Exam. ROGERS. Including the icing stations and the haul and the terminals it has to go through, and all that—you never have expressed yourself on that?

A. Not exactly in the sense that we would make more money through the Portland gateway. My attitude has been that the traffic today pays very little revenue, and perhaps the 30 per cent of the through rate was just as valuable to us via Portland as it would be by hauling it via Ogden. I got from the question that you had the idea that I can separate the traffic moving one way or the

2302 other. (4145.) I don't pretend to give any testimony in this case as to what it costs to move it one way as against the other.

Comr. McMANAMY. That is all, Mr. Mulchay.

(Witness excused.) (4146.)

Comr. McMANAMY. Briefs will be due November 15th.

(Whereupon, at 11.30 o'clock a. m., August 25, 1928, the hearing in the above entitled matter was closed.) (4147.)

The foregoing pages numbered from 1 to 2302 comprise the narrative statement of the evidence and pursuant to stipulation filed herein is now settled, as the statement of the evidence in accordance with the rules of the court.

Dated, February 8, 1932.

JOHN H. McNARY,
U. S. District Judge.

2303 In United States District Court for the District of Oregon

In equity, No. E–9113

OREGON–WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

v.

UNITED STATES OF AMERICA, DEFENDANT, and INTERSTATE COMMERCE Commission, Public Utilities Commissioner of Oregon (Successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, intervening defendants

Order approving statement of evidence, etc.

Feb. 8, 1932

It appearing that a condensed statement in narrative form of the evidence taken before the Interstate Commerce Commission has been prepared from petitioner's Exhibit No. 2 introduced in evidence in this court upon the trial of this cause, and that said statement has been lodged with the clerk of this court, and that by stipulation entitled "Stipulation re Statement of Evidence," filed in this court on the 6th day of February, 1932, the parties to said stipulation have approved said condensed statement of evidence and agreed that same may be substituted for said petitioner's Exhibit 2 on the appeal of this cause to the Supreme Court of the United States;

And it further appearing, in the opinion of the presiding judge of this court, that it will be necessary and proper that the following original papers introduced in evidence in this court upon the trial of this cause, to wit: Petitioner's Exhibits 1 and 3 to 9, inclusive, and defendants' Exhibits A, B, C, D, and E, be inspected in the Supreme Court of the United States upon the appeal thereof.

2304 It is therefore ordered that said condensed statement in narrative form so prepared from petitioner's Exhibit 2 be and the

same is hereby approved and substituted for said petitioner's Exhibit 2 and made a part of the record on appeal in this cause, and the original thereof shall be transmitted by the clerk of this court to the clerk of the Supreme Court of the United States instead of a transcript thereof.

It is further ordered that petitioner's Exhibits 1, 3, 4, 5, 6, 7, 8, and 9 and defendants' Exhibits A, B, C, D, and E, and each and all thereof be and the same are hereby made a part of the record in this cause upon appeal thereof to the Supreme Court of the United States and said original exhibits shall be transmitted by the clerk of this court to the clerk of the Supreme Court of the United States along with the transcript herein, for the consideration of the Supreme Court as a part of the record on appeal herein.

The aforesaid exhibits, namely, petitioner's Exhibits 1 to 9, inclusive, and defendants' Exhibits A, B, C, D, and E contain all the evidence submitted to this court on the hearings of this cause.

Dated this 8th day of February, 1932.

JOHN H. MCNARY,
United States District Judge.

Douglas	2,275	2,551	12.1	Total	14,307	16,508	15.3

[1] Decrease

2330 This increase in the number of farms shows the tendency to subdivide large holdings devoted to grain, livestock production, and general farming, and to establish a more intensified production of small fruits, vegetables, nuts, and poultry, products which must be rushed to consuming centers 2,000 to 3,000 miles across the continent.

NOTE.—All these figures were taken from the United States census, 1920–1925.

Car-lot imports of corn into Oregon, by years, as per records of the State grain inspection department, Portland, Oregon

Year	Carloads	Tons
1924-25	505, @ 30	15,150
1925-26	782, @ 30	23,460
1926-27	963, @ 30	28,890

Car-lot shipments of perishable vegetables, exclusive of broccoli, from western Oregon by districts

Year	District north of Linn and Benton Counties	District, Linn, Benton Counties, and south	Per cent produced in district to be benefited by proposed road
1924	399	14	3%
1925	550	1	.1%
1926	752	9	1.1%
1927	703	5	.7%

Climatic and soil conditions are very similar in the upper Willamette Valley to those prevailing in the lower valley, where 97% to 99% of the perishable vegetables, exclusive of broccoli, are
2331 produced. Vegetables are grown in the upper valley at present but almost entirely for cannery purposes. A shorter route east would be of material advantage and should stimulate the production of perishables.

NOTE.—Broccoli excluded because it can not be successfully grown north of Douglas County. Vegetables listed include asparagus, cabbage, carrots, celery, lettuce, mixed vegetables, spinach, tomatoes.

MATERIAL SAVINGS WOULD ACCRUE TO LIVESTOCK SHIPPERS IN SOUTHERN IDAHO AND SOUTHEASTERN OREGON IN REACHING NORTHERN CALIFORNIA MARKETS

From Ontario, the center of the livestock-producing territory of the region, to San Francisco via the existing routes is approximately 1,328 miles, requiring three runs and two feeds if special stock train: otherwise, four runs and three feeds.

2333 I. Shrinkage and feed cost on a car of 1,000 pounds, eight cent, steers would be about as follows via proposed route:

2 feeds, @ $17.50	$35.00	
3½% shrinkage first 400 miles; 1% for each additional run, or 5½%	110.00	
Total cost		$145.00

II. Shrinkage and feed cost via proposed route would be as follows. The distance from Ontario to San Francisco would be approximately 817 miles, which could be made in two runs and one feed.

1 feed, @ $17.50	$17.50	
3½% shrinkage first run and 1% second run	90.00	
		$107.50
Saving per car		37.50

Saving on sheep and hogs would be somewhat greater.

Butter receipts at the San Francisco and Los Angeles markets for the year 1926, with points of origin

State of origin	Pounds	Per cent from each
California	42,712,000	58.8
Oregon	4,228,000	5.8
Idaho	14,292,000	19.6
Other States [1]	11,405,000	15.8
Totals	72,637,000	100.0

[1] States from which 15.8% of butter comes: Colorado, Minnesota, Texas, Washington, Wyoming,
2339 Iowa, Kansas, Missouri, Nebraska, New York, Pennsylvania, Wisconsin, Nevada, Montana, Utah.

Data shows that California is increasing its consumption of butter from outside States at the rate of 4.3% per year (1925–1926 figures), or by 2,960,000 pounds.

Authority: Butter Market Review, U. S. Bureau of Agricultural Economics.

Cheese receipts at San Francisco and Los Angeles markets for the year 1926, by States of origin

State of origin	Pounds	Per cent from each
California	4,693,000	16.7
Oregon	6,272,000	22.5
Idaho	7,299,000	26.5
Other States [1]	9,326,000	33.9
Totals	27,590,000	99.6

[1] Other States include Colorado, Illinois, Kentucky, Massachusetts, Michigan, Minnesota, Wisconsin, and West Virginia.

Receipts of cheese at San Francisco indicate that California is increasing the amount of cheese required from outside States at the rate of four per cent annually, or by approximately 1,000,000 pounds per year.

2345 *San Francisco buys Idaho's products*

[Market News Service, United States Department of Agriculture, Bureau of Agricultural Economics cooperating with California Department of Agriculture]

1927		1927	
Eggs	6,594 cases.	Sheep and lambs	10 carloads.
Dressed poultry	1,041,473 pounds.	Apples	2 "
Butter	1,721,532 "	Onions	2 "
Cheese	3,330,898 "	Peaches	1 "
Cattle	184 carloads.	Potatoes	139 "
Hogs	356 "		

Other products shipped into San Francisco from other States, but not from Idaho

Cabbage	7 carloads.	Lettuce	7 carloads.
Celery	44 "	Peas	23 "
Cherries	1 "	Tomatoes	230 "
Cucumbers	3 "	Turnips	12 "

Idaho shipped out in 1927, but not to San Francisco

Cabbage	16 carloads.	Lettuce	477 carloads.
Celery	32 "	Pears	19 "
Cherries	121 "	Tomatoes	6 "
Cucumbers	none.	Turnips	2 "

2346 *Shipments from ten southwestern Idaho counties*

[Adams County is included with Washington County. Shipping point, Weiser]

[1] First 3 years show autos and trucks together.

2359 INCREASED REGISTRATION DOES NOT FULLY SHOW INCREASE OF AUTOMOBILES

If, as the United States Internal Revenue Office figures, 5 years is the life of a car, then replacement—

In 1923 of cars in use in 1918 would be	8,194
In 1924 " " " " " 1919 " "	11,014
In 1925 " " " " " 1920 " "	14,496
In 1926 " " " " " 1921 " "	15,494
In 1927 " " " " " 1922 " "	16,581
Replacement	65,778
Number of licenses in 1927 exceeds number in 1918 by difference between 26,439 and 8,194, or	18,245
Or a total of new cars purchased	84,023

Freight charges at an average of $150 per car would be $12,603,750.00.

2360 *Relationship of population, expenditures on roads, and autos*

2403 *Exhibit No. 7*

By Samuel L. Newton, witness for P. U. C. I.

I. C. C. docket No. 19680

Before the Interstate Commerce Commission

I. C. C. docket No. 19680

PUBLIC SERVICE COMMISSION OF OREGON

vs.

CENTRAL PACIFIC RAILWAY COMPANY ET AL.

Exhibit of the Public Utilities Commission of Idaho

POPULATION OF TEN SOUTHWESTERN IDAHO COUNTIES.—RECEIPTS OF VARIOUS COMMODITIES FROM POINTS OF ORIGIN AS SHOWN

2404 Carload freight received from North Pacific points west of the Cascade Mountains, and also from California points that might route over proposed railroad across Oregon as reported monthly on O. S. L. R. R. Form 1694 for stations named, for the year 1927.

Record is not complete, but is compiled from those reports that had been sent to office of Joel L. Priest, genl. agent, Boise.

Routing for Oregon and Washington points is shown as O. W. R. & N. from California points as RR O.-W. R. & N. or SS O.-W. R. N., indicating that shipment moved all rail (RR) or by steamship (SS) to Portland and Oregon-Washington Railroad & Navigation Company to destination. Other California shipments are shown as routing via Salt Lake City, Ogden, or Wells.

CARLOADS OF AGRICULTURAL COMMODITIES ORIGINATING IN 10 SOUTHWESTERN IDAHO COUNTIES

Exhibit of The Public Utilities Commission of Idaho

2482 *Carloads of various agricultural commodities originating in 10 southwestern Idaho counties and estimates of the portion of which will move via proposed railroad*

[1927 Idaho Public Utilities Commission records]

Commodity	Cars loaded	Estimate of cars to move via proposed railroad	Commodity	Cars loaded	Estimate of cars to move via proposed railroad
Barley	31	7	Hogs	484	240
Corn	25	6	Horses & mules	135	65
Oats	95	20	Sheep	1,803	600
Wheat	1,105	280	Eggs	208	104
Hay	476	47	Poultry	113	67
Apples	4,909	490	Butter	348	174
Potatoes	979	98			
Vegetables	578	146	Total	12,684	3,028
Cattle	1,394	650			

2483 *Additional carloads available in 1931 from present area in dairy and poultry products, applying rate of expansion during last three years to next three years*

Commodity	Carloads	Per cent increase since 1925
Eggs	60	58
Poultry	33	50
Butter	45	26
Total	138	

Additional carloads available by 1933 from bringing into production one-half of 51,350 acres, or 25,679 acres, on the Black Canyon project, assuming that twenty acres of land produce one carload of produce

[On this acreage there would be produced 1,283 carloads of produce as shown in column 1. Assuming that the crops produced would be in the same proportion to those shipped from this section in 1927, the following table shows the amount of each commodity produced:]

Commodity	Carloads produced	Est. carloads which would move over proposed route first five years	Est. total carloads which would move over proposed route when project in full production
Barley	5	2	4
Corn	4	2	4
Oats	14	4	8
Wheat	182	36	72
Hay	78	8	16
Potatoes	165	83	166
Vegetables	94	19	38
Cattle	232	116	232
Hogs	80	40	80
Horses & mules	21	10	20
Sheep	301	100	200
Eggs	33	7	14
Poultry	18	9	18
Butter	56	50	100
Total	1,283	486	972

2484 *Summary of carloads of agricultural commodities from 10 southwestern Idaho counties to move via proposed railroad*

When available:	Carloads	
At present	3,028	
Dairy and poultry industries within five years, due to their natural development	138	
Within 5 years from Black Canyon project to be irrigated	486	
Total within 5 years	3,652	3,652
After 5 years addition from projects now under construction	486	486
Total after 5 years		4,138
Potential traffic from Dry Lake, Mora, and Hillcrest, Boise extension, Mt. Home and Bruneau projects, for westbound movement	8,003	8,003
Grand total		12,141

2485 *Exhibit No. 24—Witness L. K. Cramb*

Before the Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON

vs.

CENTRAL PACIFIC RAILWAY

Exhibit of the city of Bend, Oregon, and the Bend Chamber of Commerce

[By L. K. Cramb, secretary, Bend Chamber of Commerce]

2486 INTRODUCTORY STATEMENT

The city of Bend and the Bend Chamber of Commerce join with the Public Service Commission of Oregon in support of its petition for a cross-State railroad to develop the State and to provide more direct transportation facilities to the Middle West and East, and also more direct rail connections between the eastern and western parts of the State.

It is the position of the city of Bend and the Bend Chamber of Commerce that a railroad from Bend to Crane offers all the advantages of a road from Crane to Crescent Lake and will serve the State better; that such a line, skirting the southern border of the Ochoco Mountains, will develop a much greater volume of tonnage than would a road from Crane to Crescent Lake.

The region northwest of Bend, via Sisters, across the Cascades Mountains to Albany and Salem, is heavily timbered. To harvest this timber railroad construction from Bend to Sisters and beyond will be necessary, and from Albany and Salem eastward. In fact, a logging road of standard construction is now contemplated from Albany via Foster to tap the western slope of the Cascades in this area. Plans for the construction of an east-west railroad should taken into consideration a railroad from Bend to Albany or Salem.

A railroad from Crane to Bend, and eventually west via Sisters, across the Cascade Mountains at or near Hogg Pass, will afford the relief asked for in the complaint and testimony offered by the Public Service Commission of Oregon, and in addition tap richly timbered areas, which must eventually have railroad facilities.

2487 *Agricultural statistics, Deschutes County*

	Jan. 1, 1920 Fed. cen.	Jan. 1, 1925 Fed. farm cen.	Jan. 1, 1928 est.[1]
Number of farms	721	670	800
Operated by owners	640	557	675
Managers	6	5	5
Tenants	105	108	120

	cars			4
Barley	acres			600
	bushels			18,000

2488 *Deschutes County irrigation districts*

Central Oregon irrigation district:
Irrigible acres, 48,549 (9,804 acres in Crook County).
Acres privately owned, 48,549.
Acres under cultivation, 32,000.
Operating cost, $1.70 an acre.
Deschutes County municipal improvement district (Tumalo project):
Irrigible acres, 15,389.
Acres privately owned, 14,000.
Acres under cultivation, 6,500.
Operating cost, $2 an acre.
Deschutes Reclamation and Irrigation Company (Swalley district):
Irrigible acres, 6,639.
Acres privately owned, 6,639.
Acres under cultivation, 3,000.
Operating cost, 18 cents to 90 cents an acre. (Farmers look after laterals.)

Arnold Irrigation Company:
Number irrigible acres, 9,336.
Acres under cultivation, 2,000.
Acres privately owned, 9,336.
Operating cost, $1 an acre.
Squaw Creek irrigation district:
Irrigible acres, 8,100.
Privately owned, 8,100.
Under cultivation, 8,100.
Operating cost, $1.25 an acre.
Snow Creek irrigation district:
Irrigible acres, 2,000.
Privately owned, 2,000.
Under cultivation, 1,100.
Operating cost, 70 cents an acre.
Free water rights:
Number acres, 7,000.
All privately owned and under cultivation.

2489 RECAPITULATION

Total irrigable acres	97,013
Total acres privately owned	95,624
Total acres under cultivation	59,700
Total acres not cultivated	37,313

On the basis of one family to each 80 acres of irrigated land it will take 466 families to complete settlement of these projects in Deschutes County (9,804 acres in Crook County). The tendency, however, is for the average size of irrigated farms to get smaller; that is, it is found to be more profitable to farm a fewer number of acres more intensively. So that, with the bringing into full cultivation of land not now being farmed and the reduction in the size of farms the farm population of these projects will eventually more than double the present population.

FUTURE IRRIGATION DEVELOPMENT

Approximately 150,000 acres of land in central Oregon, (Deschutes, Jefferson, and Crook Counties) will at some future time come under irrigation. This is what is known as the Deschutes project, and has been pronounced feasible by the Reclamation Department of the Federal Government. A bill in Congress providing for the reclamation of the north unit (approximately 100,000 acres) of the Deschutes project passed the Senate last winter without any opposition and is now on the Calendar of the House.

2490 *School census, Deschutes County outside of Bend, 1916 to 1927*

1916	1,137	1922	1,201
1917	1,001	1923	1,209
1918	1,053	1924	1,294
1919	1,041	1925	1,285
1920	1,062	1926	1,356
1921	1,239	1927	1,506

Increase from 1925 to 1927, 221, which represents an increase of about 773 in the farm population of Deschutes County in two years. (Factor 3½ used to ascertain population based on school census.) This, however, includes the city of Redmond, but as this city is dependent entirely upon agriculture, any increase in its population is dependent upon farm population and farm prosperity.

Increase due largely to colonization campaign by Bend Chamber of Commerce in co-operation with land settlement department of Portland chamber and State chamber of commerce: also to better methods of farming and diversification.

2491 TIMBER RESOURCES TRIBUTARY TO BEND

[Prepared from information furnished by H. L. Plumb, formerly supervisor, Deschutes National Forest]

GENERAL STATEMENT.—Bend is the logical manufacturing point for one of the finest bodies of yellow-pine timber in the United States. The trade name is "Pondosa pine," taken from the scientific name Pinus Ponderosa. The timber from the head waters of the Metolius River to the Walker Rim south of Crescent is considered tributary to the Bend mills. An estimate of the stand of timber follows;

Private timber tributary to Bend

Yellow pine	8, 400, 000, 000 ft. b. m.
Lodgepole pine and other species	200, 000, 000 ft. b. m.
	8, 600, 000, 000 ft. b. m.

National forest timber tributary to Bend

Yellow pine	4, 208, 000, 000
Douglas fir	243, 000, 000
Lodgepole pine	930, 000, 000
Other species	834, 000, 000
	6, 215, 000, 000 ft. b. m.
National forest timber	6, 215, 000, 000
Private timber	8, 600, 000, 000
Total	14, 815, 000, 000 ft. b. m.

FUTURE TIMBER OPERATIONS.—At the present rate of cutting, amounting to about 300,000,000 feet per year. the timber will last nearly 49 years, including both Government and private timber. With reforestation and selective cutting, now required of timber purchased from the Government, the supply will last indefinitely.

CUT-OVER LAND.—There are at present about 90,000 acres of cut-over land in the vicinity of Bend. More attention to the protection of the young trees on cut-over land is being given by both the lumber companies, the State and the Federal Government, through more careful logging and protection from fire.

REFORESTATION.—The Forest Service insists on leaving about 20 per cent of the volume per acre standing where timber is sold from Government lands. This will provide for another cut in 60 years,
and thus tend to make the logging industry perpetual. With
2492 properly adjusted forest taxes private companies could afford
to log their land on the same basis and thus keep the mills running indefinitely.

OCHOCO NATIONAL FOREST TIMBER.—The above computation does not take into consideration timber in the Ochoco National Forest, amounting to approximately five billion feet, which may be milled in Bend. Whether milled in Bend or Prineville the manufactured lumber would go to eastern markets.

2493 *Lumber shipments out of Bend, 1927*

S.-H. Co.—the Shevlin-Hixon Co.

2494 ANALYSES OF LUMBER SHIPMENTS

During 1927, 5,630 cars of lumber from the Bend mills went east of the Mississippi River. This represents 59.7 per cent of the total shipments. The construction of the cross-State line from Bend direct to Crane would bring markets east of the Mississi River nearly 200 miles nearer. Construction of a cross-State line direct from Bend to Crane would also bring the markets in States along the Union Pacific system approximately 200 miles nearer. This represents 1,853 cars shipped during 1927, or 19.6 per cent of total shipments, which together with shipments east of the Mississippi River represents 7,483 cars, or 79.3 per cent of total shipments.

Shipment, lumber, from Bend, 1922 to June 30, 1928

1922	7,869 cars.	1927	9,425 cars.
1923	8,562 "	1928 first six months	6,477 "
1924	11,056 "		
1925	11,712 "	Total, 6½ years	66,064 "
1926	10,963 "	Average annual shipments	10,163 "

Average freight paid on car of lumber, $414.
Approximate total freight paid, 6½ years, $27,351,506.
Freight, 1928, on basis present shipments, $5,362,956.

2495 PRESENT AND FUTURE TONNAGE CROSS-STATE RAILROAD ORIGINATING AT OR NEAR BEND, OREGON

1. LUMBER.—Average cars lumber shipped out of Bend each year past 6½ years was 10,163. Shipments first six months, 1928, were 6,477, and total shipments for 1928 will amount to nearly 13,000 cars. In view of increased demand due to decreasing supply of southern pine lumber this will not likely decrease but will increase.

Johnson-Gilchrist interests own about one billion feet pine timber in vicinity of Sisters and own a mill site in Bend with rights of way for logging road. With the cutting of this timber the shipments from Bend will be increased.

Ralph Gilchrist interests own about a billion feet of pine timber in the vicinity of Lapine, which will be milled in Lapine or Bend.

Therefore, it is not too much to expect the output of the Bend mills will amount to 18,000 cars annually within five years, the greater part of which would move over a line from Bend to Crane on account of shorter distance.

2. PAPER PULP.—Engineering studies as to the feasibility of pine waste and lodgepole pine in the manufacture of paper pulp and paper were made two or three years ago for the Brooks-Scanlon Lumber Co., with the conclusion that a high-grade kraft paper suitable for heavy wrapping and strong bags could be made economically from western pine and lodgepole pine. As sources of pulp supply in eastern and southern timbered areas are becoming exhausted, the time is not far distant when a pulp mill will be established in Bend. The Brooks-Scanlon Lumber Co. have had under consideration the establishment of a 200-ton pulp plant to use waste from its mill.

3. AGRICULTURE AND LIVESTOCK.—Mr. W. L. Teutsch estimates the shipment of clover seed via the cross-State line will increase from three cars to 15 in five years. There will be shipped this year six or seven cars, so his estimate is very conservative.

He 'stimates there will be no increase in the shipment of sheep and wool, which he gives as 341 cars. Bringing additional acreage into cultivation in central Oregon with many farmers turning to farm flocks of sheep would seem to indicate that Mr. Teutsch's figures on potential tonnage from sheep and wool are entirely too low.

Turkeys: 3½ cars of turkeys were shipped east from Redmond last year and from 6 to 8 will be shipped this year. In view of
2496 the fact that turkeys raised in central Oregon are of superior quality and that the industry have been found to be very profitable, it is probable shipments will continue to increase.

Eggs: Seven cars of eggs were shipped out of Bend and Redmond the past year by the central Oregon poultry cooperative for eastern consumption. Four cars are now in storage. On account of lack of volume it was necessary to ship these in case lots to Portland for reshipment east. Central Oregon is better adapted to the poultry industry than Petaluma, California, and within a year a two-car-lot shipment will be made directly east.

4. DIATOMITE.—At lower Bridge, west of Terrebonne and 25 to 30 miles from Bend, is a deposit of diatomite. This deposit contains about 10,000,000 tons, which is lighter, whiter, purer, and finer than that found in any other part of the country.

Mr. Arthur Krieger, managing director of the Atomite Corporation, says 10 cars monthly are being shipped at the present time, that he expects to ship 500 cars next year, and 1,000 cars in 1930.

Ninety per cent of shipments go east and would use cross-State railroad. Twenty-five tons are shipped in each car.

The use of diatomite is comparatively new. Fifteen years ago 40 cars were shipped from all the diatomite mines in the United States; last year, 10,000 carloads shipped.

2501 FEASIBILITY OF RAILROAD, ALBANY TO BEND

The following is taken from sheets No. 9 and 10, docket No. 14392, report of C. I. Kephart, examiner, to Interstate Commerce Commission, after hearings held in connection with complaint of Public Service Commission of Oregon vs. Central Pacific Railway Company et al.

"In this connection reference is made by the Southern Pacific to an apparently feasible route over the Cascades between Bend and Albany, already surveyed, which would pass through the village of Sisters, over Hogg's Pass, 55 miles north of Odell Lake, and thence down the Santiam River. A road over this route would be less expensive to construct than over the Natron cut-off and would serve more heavily forested timber areas on both sides of the mountains, pine on the east and fir on the west. This cut-off may be worthy of future consideration after a line from Burns to Prineville or Bend may have been constructed and the contiguous territory more intensively developed. But for the present purposes a cross-State route over the Natron cut-off touching western Oregon farther south is not only preferable but would assist in promptly placing on a profitable basis the fund now being expended on that work."

Statement showing total carloads and total tons of carload freight originating at or destined to points on Southern Pacific lines in Oregon and Oregon points on other roads

(a) Represents outbound movement; (b) represents inbound movement, or the reverse movement to that indicated in (a)

	Tons	Cars
Estimate of present agricultural tonnage available for movement over proposed cross-State railroad:		
Clover seed	73	5
Ryegrass	280	18
Apples	68	4
Pears	61	4
Dried prunes	694	25
Cherries	200	20
Strawberries	1,750	87
Walnuts	15	1
Canned fruits & vegetables	1,680	60
Feed grains & prepared feeds	2,500	100
Eggs	334	25
Total present tonnage available	7,655	349
Potential agricultural tonnage:		
Eggs	334	25
Pears	61	4
Dried prunes	103	4
Walnuts	15	1
Canned fruits & vegetables	840	30
Feed	500	20
Total potential tonnage	1,853	84
Summary:		
Present tonnage	7,655	349
Additional available within five years	1,853	84
Total within five years	9,508	433
Estimate of present lumber tonnage available:		
Cars moved from Albany & Mill City	345,600	8,640
Additional available within five years	345,600	8,640
Total within five years	691,200	17,280
Lumber shipments east from Toledo by rail in 1927	123,042	3,076

Timber resources of the county, thirty billion feet of marketable timber.

2545 Briefly analized 11,208 carloads, or 61.33% of the total carloads, of this so-called "bridge" traffic moves northbound through Oregon, while 7,068 carloads, or 38.67%, moves southbound through this State.

92.77%, or 16,954 carloads, of a total of 18,276 carloads of said passing or "bridge" traffic moves between California on the one hand, and points in Washington, Idaho, Montana, North and South Dakota, Minnesota, Wisconsin, other eastern States and Canada on the other, encountering neither Ogden nor El Paso gateways.

2.46% moves between New Mexico on the one hand, and Washington, Idaho, Montana, and Canada on the other and encounters neither Ogden nor El Paso routing.

4.28% moves between Texas, Louisiana, and other eastern States on the one hand, and Washington, Idaho, and Canada on the other, routed via El Paso, Texas.

0.49% moves between Utah, Wyoming, Colorado, Texas, Louisiana, and other eastern States on the one hand, and Washington State on the other routed via Ogden, Utah.

The principal commodities moving northbound as against southbound with total cars and total tons of each are shown by the following table:

2546

Commodity	Northbound		Commodity	Southbound	
	Cars	Tons		Cars	Tons[1]
Cereals	33	864		164	4,295
Fruits	1,609	25,185		325	7,922
Vegetables	919	11,266		408	5,059
Agr. prods. n. o. s.	57	1,123		22	433

[1] Ten roads embraced in the foregoing figures are:
Great Northern Railway.
Nevada-California-Oregon Railway.
Northern Pacific Railway.
Oregon Short Line Railroad.
Oregon Trunk Railway.
Oregon-Washington & Navigation Company.
Southern Pacific Company.
Spokane-Portland & Seattle Railway.
Sumpter Valley Railway.
Valley and Siletz Railroad.

State of Oregon—Recapitulation—Ten large steam roads (Classes I and II), revenue freight carried in Oregon—Continued

2583 It will be noted that the total total tonnage originated within the State on the lines of the 31 steam carriers increased yearly from 9,171,984 tons in 1922 to 14,238,078 tons in 1926, an increase of 5,066,094 tons, or 35.58%. This total tonnage, computed on a five-year basis, is 7.87% agriculture, 1.41% livestock, 4.09% mines, 78.05% forests, 6.29% mfgrs. & misc., 2.28% l. c. l. mdse.

Similar statistics covering the electric lines are not available.

Likewise the annual reports for small steam carriers do not carry full commodity statistics to enable the segregation of logs, posts, poles, and cordwood from all other commodities embraced in the 70-commodity classification of the large steam roads, but owing to the relatively heavy log tonnage there follows the total cars and total tons of logs compared to other commodities comprising "forest products" for the years 1922 to 1926, inclusive.

Commodity No.		Cars	Tons
	1926		
40	Logs, posts, poles, & cordwood	110,804	3,910,819

Clem, "	7.49	2.05			
Condon, "	74.92	83.96			

NOTE: The above branches representing O. W. R. & N. Co. branch line operations in Oregon account for the origination of 20,464 carloads totaling 620,519 tons.

Using the 1926 Annual Report figures as a basis, would leave 52,960 carloads totaling 1,526,465 tons as originating on the remaining lines of the O. W. R. & N. Co. in Oregon.

Bearing in mind possible differences in compilation of the branch line statements and the Annual Report figures, this shows the former to represent 27.87% of the carloads and 28.9% of traffic originating in Oregon.

2586 EASTERN OREGON TRAFFIC

Eastern Oregon traffic or traffic generally designated as east of the Cascades and contiguous to proposed cross-State line is recorded in different sections of this report and accompanying exhibit.

As the following letter will show, statistics covering the lumber traffic from the Bend mills were secured for the calendar year 1926, and in addition thereto the writer personally abstracted from the records of these companies in Bend, Oregon, similar statistics for 1927 to the latest date available (Sept., 1927).

WESTERN PINE MANUFACTURERS ASSOCIATION,
Portland, Oregon, Sept. 16, 1927.

Mr. HAL F. WIGGINS,
Public Service Commission,
Salem, Oregon.

DEAR SIR: Our records show that the following lumber shipments were made from Bend, Oregon, during the calendar year 1926.

Shipments east thru Huntington, Oregon	3,410 cars.
Shipments to Oregon, Washington, California, Nevada, Arizona, Canada, & Export	520 "
Shipments east thru northern gateways (balance)	7,032 "
Total shipments, 1926	10,962 cars.

The attached table shows the detailed distribution of the shipments from Bend during 1926. These shipments include, in addition to the lumber shown, some lath and other material on which board-measure footage was not available.

Yours truly,

WESTERN PINE MANUFACTURERS ASSOCIATION.
S. J. S., *Statistician.*

SJS/ES.

2618 *Exhibit 34—Newell*

Potential net earnings of carriers, by Alturas route, compared with those of cross-State route, if cost is calculated on basis of three mills per gross ton-mile

I. ON CAR FIR LUMBER FROM EUGENE, DESTINED OMAHA

Freight charge 70,000 lbs. @ 62½¢	$437.50
Via Alturas:	
Southern Pacific—	
Eugene to Ogden, earnings	253.75
Cost, 984 miles x 56 tons x $.003	165.31
Net earnings	88.44
Union Pacific—	
Ogden to Omaha, earnings	183.75
Cost, 990 miles x 56 tons x $.003	166.32
Net earnings	17.43
Net, per mile	1.76¢
Via Crane:	
Southern Pacific—	
Eugene to Crescent Lake—	
Cost, 96 miles x 56 tons x $.003	$16.13
Net as above	88.44
Gross required to produce same net	104.57
Balance of total charge	332.93
Union Pacific—	
Cost, 1,659 miles x 56 tons x $.003	278.71
Net earnings	54.22
Net, per mile	3.27¢

II. ON CAR FIR LUMBER DESTINED BEYOND OMAHA

Freight earnings 70,000 lbs. @ 55¢	$385.00
Via Alturas:	
Southern Pacific—	
Eugene to Ogden, earnings	224.00
Cost, 984 miles x 56 tons x $.003	165.31
Net earnings	58.69
Union Pacific—	
Ogden to Omaha, earnings	161.00
Cost, 990 miles x 56 tons x $.003	166.32
Net loss	5.32
Loss, per mile	0.54¢
Via Crane:	
Southern Pacific—	
Eugene to Crescent Lake—	
Cost, 96 miles x 56 tons x $.003	$16.13
Net as above	58.69
Gross required to produce same net	74.82
2619 Union Pacific—	
Balance of freight charge	310.18
Cost, 1,659 miles x 56 tons, x $.003	278.71
Net earnings	31.47
Net per mile	1.90¢

(Compare page 111a, Exhibit 16.)

III. ON CAR PINE LUMBER FROM KLAMATH FALLS, DESTINED OMAHA

Freight earnings 51,000 lbs. @ 62½¢	$318.75
Via Alturas:	
Southern Pacific—	
Klamath Falls to Ogden, earnings	184.88
Cost, 790 miles x 46.5 tons x $.003	110.21
Net earnings	74.67
Union Pacific—	
Ogden to Omaha, earnings	133.87
Cost, 990 miles x 46.5 tons x $.003	138.10
Net loss	4.23
Via Crane:	
Southern Pacific—	
Klamath Falls to Chemult—	
Cost, 74 miles x 46.5 tons x $.003	10.32
Net as above	74.67
Gross required to produce same net	84.99
Union Pacific—	
Chemult to Omaha—	
Balance of freight charge	233.76
Cost, 1656 miles x 46.5 tons x $.003	231.01
Net earnings	2.75
Increase of net	6.98

IV. ON CAR PINE LUMBER FROM KLAMATH FALLS, DESTINED OMAHA

Freight earnings 51,000 lbs. @ 55¢	$280.50
Via Alturas:	
Southern Pacific—	
Klamath Falls to Ogden, earnings	162.69
Cost, 790 miles x 46.5 tons x $.003	110.21
Net earnings	52.48
Union Pacific—	
Ogden to Omaha, earnings	117.81
Cost, 990 miles x 46.5 tons x $.003	138.10
Net loss	20.29
2620 Via Crane:	
Southern Pacific—	
Klamath Falls to Chemult—	
Cost, 74 miles x 46.5 x $.003	10.32
Net as above	52.48
Gross required to produce same net	62.80
Union Pacific—	
Chemult to Omaha—	
Balance of freight charge	217.70
Cost, 1,656 miles x 46.5 tons x $.003	231.10
Net loss	13.31
Decrease of net loss	6.98

2621 *Exhibit 35—Newell*

Potential net earnings of carriers by Alturas route compared with those of cross-State line, using constructive mileage and operating ratios to determine cost

The operating ratio for the Southern Pacific system in 1925 was 71%, and for the State of Oregon 87%. Since about 18% of the distance from Eugene via Roseville to Ogden is in Oregon I take the operating ratio for this haul as 74%. The Oregon Short Line ratio for the same year was 71%.

I allow constructive mileage of 125 miles to the Southern Pacific for origination and 100 to the Union Pacific for delivery; also 97 miles for the heavy grades of the Sierra Nevada Mountains between Rocklin and Tuckee, and 46 miles for the Cascade Mountains between Westfir and Cascade Summit. This makes respective mileages as follows:

Eugene–Roseville–Ogden	1,462 miles.
Eugene–Alturas–Ogden	1,155 "
Eugene–Crescent Lake	142 "
Ogden–Omaha	1,090 "
Crescent Lake–Omaha	1,759 "

These calculations are confined to the haul of lumber from Eugene.

I. CAR DESTINED OMAHA

Freight charges 70,000 lbs. @ 62½¢	$437.50

The Southern Pacific share in the joint rates is based on the haul via Roseville and I therefore use that as the basis of its cost per mile. Its share in the above rate would be $253.75. At an operating ratio of 74%, its cost would be $187.78, or for the above constructive mileage 12.84¢ per mile.

Via Alturas:	
Southern Pacific—	
Eugene to Ogden, earnings	$253.75
Cost, 1,155 miles @ 12.84¢	148.30
Net	105.45
2622 *Union Pacific*—	
Ogden to Omaha, earnings	183.75
Cost, $183.75 x 71%	130.46
Net	53.29
Net per mile (990)	5.38¢
Cost per mile (1,090)	11.97¢
Via Crane:	
Southern Pacific—	
Eugene to Crescent Lake—	
Cost, 142 miles @ 15.10¢ (87% op. ratio)	$21.44
Net as above	105.45
Gross required to produce same net	126.89
Union Pacific—	
Crescent Lake to Omaha, earnings	310.61
Cost, 1,759 miles @ 11.97¢	210.55
Net	100.06
Net per mile (1,659)	6.03¢
Increase in net per mile	0.65¢

II. CAR DESTINED BEYOND OMAHA

Freight earnings 70,000 lbs. @ 55¢	$385.00
Cost via Roseville = $224 x 74%	165.76
Cost per constructive mile	11.34¢
Via Alturas:	
Southern Pacific—	
Eugene to Ogden, earnings	$224.09
Cost, 1,155 miles @ 11.34¢	130.98
Net	93.02
Union Pacific—	
Ogden to Omaha, earnings	161.00
Cost, $161 x 71%	114.31
Net earnings	46.69
Net per mile (990)	4.72¢
Cost per mile (1,090)	10.49¢
Via Crane:	
Southern Pacific—	
Eugene to Crescent Lake—	
Cost, 142 miles x 13.33¢ '87% ratio	$18.93
Net as above	93.02
Gross required to produce net	111.95
Union Pacific—	
Crescent Lake to Omaha, earnings	273.00
Cost, 1,759 miles @ 10.49¢	184.51
Net earnings	88.49
Net per mile (1,659)	5.34¢
Increase in net per mile	0.62¢

2623 *Exhibit 36—Newell*

Car fir lumber, Eugene to Omaha via Portland 56 tons

Southern Pacific:	
Eugene to Portland, load—	
123 miles. Equivalent rise per mile, 8.9 ft. Add locomotive weight as for empty south, 2.9 tons—	
Train miles, 123 ÷ 56 x 63.8¢	$1.40
Car mile, 123 x 2.59¢	3.13
Gross ton-mile, 123 x 62.1 T. x .02¢	1.53
Resistance, 59.2 T. x 1,090 x .00496¢	3.24
Add 9%	0.84
	10.15
Portland to Eugene, empty:	
123 miles. Equiv. rise per mile, 27.3 ft. Loco. weight, 27.3 x 21 x .0051 = 2.9 tons—	
Train and car mile as above	4.58
Gross ton-mile, 123 x 27.1 T. x .02¢	0.67
Resistance 24.2 T. x 3360 x .00496¢	4.03
Add 9%	0.84
	10.12

Summary:	
Southern Pacific—	
Eugene to Portland, load	$10.15
Portland to Eugene, empty, $10.12 x 60%	6.07
Origination at Eugene, as on page 69, Ex. 16	12.00
Interchange at Portland	5.06
Total Southern Pacific	33.28
Union Pacific—	
Portland to Omaha, load	185.89
Omaha to Portland, empty, 139.14 x 60%	83.48
Interchange at Portland	5.06
Delivery at Omaha, page 71, Ex. 16	9.50
	283.93
Total Eugene to Omaha via Portland	$317.21
Eugene to Omaha via Roseville (p. 71)	$372.40
Eugene to Omaha via Alturas (p. 73)	$323.90
Eugene to Omaha via Crane (p. 75)	$290.90

2624 *Exhibit 38*

[Addition to Exhibit No. 24. City of Bend and the Bend Chamber of Commerce. To be inserted following page number 8]

THE SHEVLIN-HIXON COMPANY,
Bend, Oregon, August 13th, 1928.

Mr. L. K. CRAMB,
Secretary Bend Chamber of Commerce,
Bend, Oregon

DEAR SIR: Attached is a statement of cars shipped during the year 1927 shipped via the Union Pacific Railway showing the approximate distribution as to States.

For your information, in the case of the States of Iowa and Minnesota, and more particularly Iowa, the Union Pacific was short hauled on a goodly portion of the number of cars shown. This was brought about by the position taken by the C. M. & St. P. & R. Ry. on milling in transit on lumber which went into effect early last year, which created for them a considerable volume of business going to factories buying shop lumber on the Mississippi, and in Minnesota and Wisconsin, this U. P. short-hauled business going to the Milwaukee at Marengo, Wash. The figures in the statement might vary a little if subjected to an actual check, but think they are reasonably accurate and will serve the purpose.

Very truly yours,

THE SHEVLIN-HIXON COMPANY,
C. J. MONAHAN,
Asst. Traffic Mgr.

2625 *The Shevlin-Hixon Company, Bend, Oregon—Statement of approximate distribution of cars, by States, shipped during year 1927, via the Union Pacific system*

2626 BROOKS-SCANLON LUMBER CO.,
Bend, Oregon, August 14, 1928.

Mr. L. K. CRAMB,
Sec., Bend Chamber of Commerce,
Bend, Oregon.

DEAR SIR: In reply to your request for data on the movement of our shipments out of Bend during the year 1927 we regret that the manner in which our records are kept makes it impractical, in the limited time at our disposal, to furnish you a list of the cars shipped by us last year into the different States over the Union Pacific System. Many of our shipments are billed out of Bend showing a destination of Omaha, Minneapolis, or Chicago, and are diverted or reconsigned by the consignee to points further east. The final destination ordinarily being of no concern to us as we are interested in the payment of freight only to the point to which the shipment was originally consigned.

During the year 1927 we shipped 4,155 carloads and we find that of this total approximately 40%, or 1,662 cars, were routed in connection with the Union Pacific System. Of the total shipments approximately 57%, or 2,370 cars, were consigned to Chicago and points east; of these shipments approximately 50%, or 1,185 cars, were handled by the Union Pacific System.

The Union Pacific naturally carries the bulk of our business shipped into the States of Utah, Colorado, Nebraska, and Kansas, as many of our shipping points in these States are located on their tracks. During the past year the bulk of our shipments into the State of Iowa were handled in connection with the O. W. R. & N., particularly to points along the Mississippi River. The northern lines, namely, the Northern Pacific and the Great Northern, during the past year handled the bulk of our shipments into the States of Minnesota, Wisconsin, North

Dakota, and Montana, which is the natural territory of these roads, as well as the eastern shipments routed across the Great Lakes. We find that during the year 1927 each of the last-named railroads handled approximately 30% of our tonnage and the Union Pacific System carried the balance, or as stated above, approximately 40%.

Regretting that we are unable to give you the information requested in detail and trusting the above will be of some assistance, we are,

Yours very truly,

BROOKS-SCANLON LUMBER COMPANY,
H. E. ALLEN, *Assistant Manager.*

2640 No. 13.

While a so-called "overproduction" of lumber has been reported during the past five years, the entire supply has moved into consumption at a price not altogether favorable.

No. 14.

Heavy production has caused a weakening in lumber prices during recent years—demand, however, has absorbed the cut, due in part to phenomenally large construction programs throughout the country. At present, values are firmer, and this in the face of less building throughout the consuming markets. Curtailment of output accounts for part of the present market strength.

No. 15.

Profits as a whole in Oregon, Washington, and Idaho have not been satisfactory to the mills as a whole during recent years. Well located plants with good timber and efficient management have shown a fair profit.

No. 16.

As a whole, the selling price and manufacturing costs have been exceedingly close. A margin of profit depends on the factors mentioned in question No. 15.

No. 17.

New mills may be erected from time to time. These will be required to salvage insect infested timber; overripe timber; or to liquidate timber investments. Rate of new construction will depend on future market conditions, increasing tax burden, etc. Present mills may be replaced with larger and more efficient plants.

2641 No. 18.

Yes; when built to safeguard owners' timber investments or to salvage timber in jeopardy from a variety of causes.

No. 19.

Some additional construction may be advisable in southwestern Oregon, the Olympic Peninsula of Washington, and parts of Idaho to develop timber reserves.

No. 20.

Southern pine production—1920–1926

[In M feet B. M.]

1920	11, 091, 000	1924	12, 486, 590
1921	10, 959, 863	1925	13, 235, 936
1922	11, 500, 771	1926	11, 751, 647
1923	12, 948, 687		

Figures for 1926 show southern pine production to be almost stationary since 1920. A falling off of approximately 10% is noted for 1926 compared with 1923. A relatively larger decrease should be apparent from 1927 and subsequently.

No. 21.

This decrease is smaller than generally anticipated.

No. 22.

Incorrect inventories of remaining timber and remarkable increase in the number of portable or semiportable mills, have been factors in prolonging the high production level of Southern pine.

No. 23.

A fairly large volume of lumber will continue to be produced in the South for many years. The number of large sawmills will decline fairly rapidly from now on.

2642 No. 24.

Southern pine producing States, showing 1926 lumber cut in M feet

Special D-19-4-170.

Oregon-Washington Railroad & Navigation Company—Statement of net railway operating income showing revenues and expenses by accounts, assignable to the Des Chutes Railroad Company, extending from Sherman, Oregon, to Bond, Oregon, as taken into the accounts of the Oregon-Washington Railroad & Navigation Company, for the calendar year 1926

Account		Amount
Revenues:		
101.	Freight	$439,259.09
102.	Passenger	30,037.68
103.	Excess baggage	616.04
104.	Sleeping-car	
105.	Parlor and chair car	
106.	Mail	15,129.68
107.	Express	6,898.20
108.	Other passenger-train	38.00
109.	Milk	212.48
110.	Switching	
111.	Special service train	
112.	Other freight-train	
131.	Dining and buffet	
132.	Hotel and restaurant	
133.	Station, train, and boat privileges	29.31
134.	Parcel room	
135.	Storage, freight	281.62
136.	Storage, baggage	
137.	Demurrage	520.00
138.	Telegraph and telephone	
139.	Grain elevator	
140.	Stockyard	
141.	Power	
142.	Rents of buildings and other property	47.27
143.	Miscellaneous	1,374.87
151.	Joint facility, credit	2,390.20
152.	Joint facility, debit	74.96
	Total operating revenues	496,759.48
Expenses:		
	Maintenance of way and structures	204,409.29
	Maintenance of equipment	97,943.43
	Traffic expenses	30,700.58
	Transportation expenses, rail line	116,881.44
	Miscellaneous operations expenses	
	General expenses	48,753.30
	Transportation for investment, credit	
	Total operating expenses	548,688.04
	Revenues over expenses (deficit)	51,928.56
	Total taxes	41,804.28
	Uncollectible railway revenues	11.46
	Railway operating income (deficit)	93,744.30
	Equipment rents, net, debit	95,296.22
	Joint facility rents, net, debit	66,644.69
	Net railway operating income (deficit)	255,685.21
2700	Maintenance of way and structures:	
201.	Superintendence	19,567.36
202.	Roadway maintenance	24,445.62
203.	Roadway, depreciation	
204.	Underground power tubes	
205.	Underground power tubes, depreciation	
206.	Tunnels and subways	3,652.22
207.	Tunnels and subways, depreciation	
208.	Bridges, trestles, and culverts	27,359.27

	Account	Amount
	Maintenance of way and structures—Continued.	
	209. Bridges, trestles, and culverts, depreciation	
	210. Elevated structures	
	211. Elevated structures, depreciation	
	212. Ties	$28,791.04
	213. Ties, depreciation	
	214. Rails	6,212.77
	215. Rails, depreciation	
	216. Other track material	3,550.84
	217. Other track material, depreciation	
	218. Ballast	2,735.55
	219. Ballast, depreciation	
	220. Track laying and surfacing	69,284.27
	221. Right-of-way fences	1,198.44
	222. Right-of-way fences, depreciation	
	223. Snow and sand fences and snowsheds	5.28
	224. Snow and sand fences and snowsheds, depreciation	
	225. Crossings and signs	182.07
	226. Crossings and signs, depreciation	
	227. Station and office buildings	1,696.29
	228. Station and office buildings, depreciation	
	229. Roadway buildings	2,978.11
	230. Roadway buildings, depreciation	
	231. Water stations	1,378.64
	232. Water stations, depreciation	
	233. Fuel stations	45.37
	234. Fuel stations, depreciation	
	235. Shops and enginehouses	
	236. Shops and enginehouses, depreciation	
	237. Grain elevators	
	238. Grain elevators, depreciation	
	239. Storage warehouses	
2701	240. Storage warehouses, depreciation	
	241. Wharves and docks	
	242. Wharves and docks, depreciation	
	243. Coal and ore wharves	
	244. Coal and ore wharves, depreciation	
	245. Gas producing plants	
	246. Gas producing plants, depreciation	
	247. Telegraph and telephone lines	642.77
	248. Telegraph and telephone lines, depreciation

Water-borne shipments	1, 694, 167	1, 774, 523	3, 129, 170	3, 675, 994	3, 959, 130
Per cent water-borne to total produced	22. 35%	32. 52%	35. 90%	39. 95%	45. 50%

	1925[1]	1926[1]	1927[1]
Rail shipments	4, 235, 193	4, 244, 157	4, 352, 103
Water-borne shipments	4, 876, 179	5, 560, 064	5, 568, 599
Total	9, 111, 372	9, 804, 221	9, 920, 702
Per cent water-borne	53. 52%	56. 71%	56. 13%

[1] These are approximate figures calculated from rail distribution shown in West Coast Lumbermen's Association Circular No. 4618, using estimated average loading of 27,000 feet b. m. per car; also water-borne distribution shown on last page of same circular. The relatively smaller percentages of water-borne to total lumber produced, as shown for the years 1920 to 1924, above, are influenced by the inclusion in "Total lumber produced" of lumber sold locally, used in plant and company account, railroad purchases sold f. o. b. mill, and lumber inventories.

2729–2730 *Exhibit 93*

2731 WEST COAST LUMBERMEN'S ASSOCIATION

[Circular No. 4618, Seattle, Washington, April 23, 1928]

Three-year distribution record of West Coast Lumber and shingles

[Following tabulation is an accurate record of lumber and shingle shipments from the Douglas Fir region (West Coast) for the past three calendar years. Figures of rail distribution have been furnished West Coast Lumbermen's Association by the transcontinental railroads; the water shipments by Pacific Lumber Inspection Bureau.]

* Indicates percentage of distribution to each market in relation to entire rail movement

2743 *Exhibit No. 107—Witness J. P. Newell*

Before the Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON

vs.

CENTRAL PACIFIC RAILWAY

No. 19680

Supplement to Exhibit 16—Additional potential earnings of cross-State line

2744 ADDITIONAL POTENTIAL EARNINGS OF CROSS-STATE LINE

Mention is made on page 140 of Exhibit 16 of traffic other than that shown therein, the evidence of which could not be collected in time for inclusion for that exhibit. For part of it, it was necessary to await the testimony given by the witnesses before the commission. This exhibit presents data contained in statements of various witnesses as to the amount of such traffic with calculations of moving it, estimates of the resulting earnings and revisions of tables of net earnings and return given in Exhibit 16.

The additions consist of:

Traffic from San Francisco and vicinity to Oregon points east of Crane.
Outbound from Alkali Lake.
Inbound to Alkali Lake.
Inbound to points of cross-State line.
Westbound from Idaho.
Eastbound to Idaho.

In calculating the cost of haul the allowance for empty car movement has been, as with the traffic originated in Oregon, 60% to eastbound and 30% to westbound. Most of this tonnage is of commodities taking relatively high rates and much of it is short-haul. The net earnings from it, therefore, make a substantial addition to the revenues of the cross-State line, but I think not unduly large, since a
2745 considerable part will be originated by that line, and the growth of the remainder will be stimulated by the use of the shorter route.

San Francisco and Vicinity to Oregon Points East of Crane

Testimony was given by Mr. S. L. Newton, of Idaho, in Exhibit 5, as to certain commodities inbound to points on existing lines in eastern Oregon. All of this will move from Crescent Lake to Crane when the cross-State line is built. Comparison of summaries of Mr. Newton's estimates of car-mile and ton-mile earnings show an average of 18 net tons per car. The cost per car would be $25.25, which for the 75 cars of the first year would amount to $1,894. Mr. Wiggins' Exhibit 105, shows gross earnings of $6,302. The net earnings on this traffic would have been $4,408.

For the fifth year the cost for 113 cars would be $2,853, gross earnings, (Exhibit 105), $9,495 and net $6,642.

The other years are interpolated on the basis of a uniform increase as follows:

Second year, $4,966.
Third " 5,525.
Fourth " 6,084.

Alkali Lake outbound

Mr. H. L. Emerson testified that on completion of the cross-State line a plant would be promptly established at Alkali Lake and that operations would begin on the basis of a minimum of 50 tons per day. Mr. Wiggins has estimated this as 500 cars for the first year, increasing uniformly to 750 cars in the fifth year. See Exhibit 105.

2746 The junction point of the spur to Alkali Lake has been taken as 100 miles from Crescent Lake, and the spur is estimated as 20 miles long. It is assumed that the shipper will deliver traffic to the main line at his own expense, hence cost and revenue are figured from the junction, called Wagontire.

The cost from Wagontire to Crescent Lake is estimated at $12.70 per car. For 500 cars this makes $6,350 for the first year. The gross earnings, Exhibit 105, would be $14,850 and the net, $8,500.

For the fifth year, 750 cars, cost $9,525, gross earnings $22,275, net, $12,750.

Second year, net earnings, $9,562.
Third " " " 10,625.
Fifth " " " 11,688.

Alkali Lake inbound

Mr. Wiggins' Exhibit 105, has estimated construction materials for the first year together with fuel and other supplies proportional to output for each year. The first year's estimate is 265 cars of 33 tons each. The cost of haul at $14.30 per car would be $3,790; gross earnings, Exhibit 105, $14,005; net $10,215.

For the second year, with fuel and supplies only to haul in, the number of cars is estimated at 112, which would cost $1,602; gross earnings $6,184; net $4,582.

For the fifth year, 151 cars, cost $2,159; gross earnings $8,334; net $6,175.

Third year, net earnings, $5,113.
Fifth " " " 5,644.

2747 Inbound to points on cross-State line

Mr. Lounsbury's Exhibit 74, showing probable tonnage to points on cross-State line, in Docket 14392, covered 1,580 tons of merchandise, which I have estimated at 4½ tons per car, making 352 cars; and 2,336 tons of other freight, estimated, on the basis of average loading of each commodity at 22 tons per car, making 106 cars. According to the distribution shown by Mr. Lounsbury, and the

estimated loading as above, there were 352 cars, with loads of 4.5 tons each, to move east an average distance of 78 miles, 40 cars, of 22 tons each moving east 89 miles, and 66 cars, of 22 tons each, moving west 45 miles.

I calculate the cost of the 352 cars east at $9.80 each, total $3,450; of the 40 cars east at $12.10, total $484; and of the 66 cars west at $5.50, total $363.

The earnings attributed to the cross-State line by Mr. Lounsbury are a much larger proportion of the total than they would be on the mileage basis which Mr. Wiggins has used. I therefore in this case add terminal expenses to the road-haul costs, adding $9.60 per car for delivery of 458 cars, total $4,397; and $4.80 for interchange of 392 cars, total $1,882. This is a total cost of $10,576. Mr. Lounsbury's estimate of earnings is $16,771. The net would therefore be $6,195.

Mr. Lounsbury's estimates for the succeeding years are not on the basis of uniform increase, nor does he give earnings separately from the cross-State line for each year. I take both cost and earnings as proportional to his estimated tonnage for each year and obtain the following:

First year,	3,916	tons,	cost	$10,576,	earnings	$16,771,	net	$6,195.
Second "	4,320	"	"	11,667	"	18,501	"	6,834.
Third "	5,144	"	"	13,892	"	22,030	"	8,138.
Fourth "	5,845	"	"	15,786	"	25,032	"	9,246.
Fifth "	6,890	"	"	18,608	"	29,508	"	10,900.

2748 Traffic from ten southwestern counties of Idaho, westbound

Mr. Newton's [Spangleri] Exhibit 23, shows cars of various commodities as shown below for the first and fifth years:

Crane to Crescent Lake

FIRST YEAR

Cars	Commodity	Tons per car	Cost per car	Total cost
313	Grain	45	$26.04	$8,150
47	Hay	15	22.10	1,039
490	Apples	15	34.12	16,719
98	Potatoes	18	34.52	3,383
180	Vegetables	15	34.12	6,142
650	Cattle	13	21.70	14,105
240	Hogs	11	21.45	5,148
65	Horses and mules	14	20.95	1,362
600	Sheep	11	21.45	12,870
104	Eggs	13	33.87	3,522
67	Poultry	14	34.00	2,278
174	Butter	16	34.25	5,960
3,028	Total direct cost			80,678
	Gross earnings, from Mr. Wiggins' Exhibit (105)			158,531
	Net earnings			77,853

Crane to Cresent Lake—Continued

2749 FIFTH YEAR

Cars	Commodity	Tons per car	Cost per car	Total cost
357	Grain	45	$28.04	$9,206
55	Hay	15	22.10	1,216
490	Apples	15	34.12	16,719
181	Potatoes	18	34.52	6,246
199	Vegetables	15	34.12	6,790
766	Cattle	13	21.70	16,622
280	Hogs	11	21.45	6,006
75	Horses and mules	14	20.95	1,571
700	Sheep	11	21.45	15,015
171	Eggs	13	33.87	5,792
109	Poultry	14	34.00	3,706
269	Butter	16	34.25	9,213
3,652	Total direct cost			98,194
	Gross earnings, from Mr. Wiggins' exhibit (106)			195,236
	Net earnings			97,042

On the basis of uniform increase, the earnings of the other years would be, second, $82,650; third, $87,448; fourth, $92,245.

2750 Traffic into ten southwestern counties of Idaho, eastbound

Mr. Newton's Exhibit 7, shows a varied list of commodities whose average loading would be about 18 tons. The cost would be $25.25 per car for 870 cars, total $21,968 for the first year. Gross earnings, $65,745; net, $43,777.

For the fifth year, 1,306 cars at cost of $32,976; earnings $98,683; net $65,707. For other years net earnings:

Second year	$49,260
Third "	54,742
Fourth "	60,224

The net earnings from these blocks of traffic are summarized thus:

Year	First	Second	Third	Fourth	Fifth
San Francisco to eastern Oregon	$4,408	$4,966	$5,525	$6,084	$6,642
Alkali Lake, outbound	8,500	9,562	10,625	11,688	12,750
Alkali Lake, inbound	10,215	4,582	5,113	5,644	6,175
Inbound to cross-State line	6,195	6,834	8,138	9,246	10,900
Idaho, westbound	77,853	82,650	87,448	92,245	97,042
Idaho, eastbound	43,777	49,260	54,742	60,224	65,707
	150,948	157,854	171,591	185,131	199,216

Table XX of Exhibit 16, revised by inclusion of additional earnings

Year	Return	Rate of return
First	$1,688,704	17.0%
Second	1,905,410	19.2
Third	2,128,947	21.5
Fourth	922,856	9.3
Fifth	1,035,058	10.4

2751 On the alternative proposal of division of rates for the first three years based upon the construction of the Alturas line [Modoc Northern] before the cross-State line, the return would be as follows:

Table XXII of Exhibit 16, revised by inclusion of additional earnings

Year	Return	Rate of return
First	$594,497	6.0%
Second	642,614	6.5
Third	697,363	7.0
Fourth	922,856	9.3
Fifth	1,035,058	10.4

Consideration of the return on investment as given above shows that diversion of the entire traffic of western Oregon to the cross-State line is not required in order to provide the new route with sufficient traffic to justify it. If there be no compulsory interchange between the carriers at Crescent Lake, a considerable part of the traffic which I have claimed for the new line would be subject to competition between the carriers. This would include all the "Traffic diverted" except that to and from Bend, and nearly all of the "Traffic created," eastbound.

In Table XXI, of Exhibit 16, "Traffic of cross-State line by alternative proposal," there is credited to the cross-State line earnings for the first year on this competitive traffic of $715,340 less $145,607 = $569,733, under "Traffic diverted," while Mr. Wiggins' Exhibit 28, shows $54,486 earned from eastbound "Traffic created." The sum of these is $624,219. Similar calculations show competitive traffic for the second year of $645,233; third, $666,248; fourth, $839,712; fifth, $911,508. If the cross-State line secured one-half of this business, its earnings would be as follows:

2752 *Table XXII of Exhibit 16, revised by exclusion of half of earnings on competitive traffic*

Year	Return	Rate of return
First	$282,387	2.9%
Second	320,000	3.2
Third	364,239	3.7
Fourth	503,000	5.1
Fifth	579,304	5.8

Any arrangement whereby the cross-State line can be assured of one-half of the traffic which might otherwise be carried via Alturas or Roseville, will, in my opinion, justify an order by the Interstate Commerce Commission for its building.

2753 *Exhibit No. 108.—Witness Day*

I. C. C. Docket 19680

Southern Pacific Company (Pacific lines)—Correction of Mr. Newell's Exhibit 16 as shown in Table XXI for 1st year, page 141, and as shown in Table XIX for 5th year, page 136. Corrections are made account erroneous cost of empty car haul and high cost data used

	1st year	5th year
Diverted traffic		
	(a)	(b)
1. Net earning from diverted traffic (per Mr. Newell)	$715,340	$1,047,033
2. Deduct for empty car haul	180,479	262,130
3. Leaving cost on Mr. Newell's cost data	534,861	784,903
4. Less ⅓ account cost data too high	178,287	261,634
5. Corrected figure on diverted traffic	356,574	523,269
Created traffic		
6. Total direct cost per Mr. Newell	124,589	210,568
7. Less ⅓ account cost data too high	41,530	70,189
8. Corrected direct cost	83,059	140,379
9. Gross earnings	255,918	402,497
10. Net earning on created traffic	172,859	262,118
Recapitulation		
11. Net earnings from diverted traffic	356,574	523,269
12. " " " created	172,859	262,118

Interstate Commerce Commission, Washington

I, George B. McGinty, secretary of the Interstate commerce Commission, do hereby certify that the attached are true copies of the following:

Complaint filed May 24, 1927, and answer of the Des Chutes Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad and Navigation Company, and Union Pacific Railroad Company, filed July 5, 1927,

in case No. 19680, Public Service Commission of Oregon v. Central Pacific Railway Company et al., the originals of which are now on file and of record in the office of this Commission.

In witness whereof I have hereunto set my hand and affixed the seal of said commission this 17th day of June, A. D. 1930.

[SEAL.] GEORGE B. McGINTY,
Secretary of the Interstate Commerce Commission.

U. S. District Court, District of Oregon. Filed Sep. 29, 193. G. H. Marsh, clerk, by H. L. Kenyon, deputy.

2762 [Omitted.]

2763 Before the Interstate Commerce Commission

Docket No. 19680

Filed July 5, 1927

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT

vs.

CENTRAL PACIFIC RAILWAY COMPANY ET AL., DEFENDANTS

ANSWER OF DEFENDANTS DES CHUTES RAILROAD COMPANY, OREGON SHORT LINE RAILROAD COMPANY, OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, AND UNION PACIFIC RAILROAD COMPANY

The defendants Des Chutes Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, and Union Pacific Railroad Company for answer to the complaint herein admit, deny, and allege as follows:

I

Answering Paragraph II they deny that the Des Chutes Railroad Company is a common carrier engaged in the transportation of passengers or property, wholly or at all, by railroad between points in the State of Oregon and points in other States, or that as such common carrier it is subject to the provisions of the interstate commerce act as amended or supplemented, except that by railroad ownership and by trackage rights acquired by it from the defendant Oregon Trunk Railway, the defendant Des Chutes Railroad Company has a line of railroad extending from a point of connection with the
2764 main line of the Oregon-Washington Railroad & Navigation Company near the mouth of the Deschutes River in Oregon southerly to Bend, Oregon, and that said line of railroad is, and has been for many years last past, operated under lease by said Oregon-Washington Railroad & Navigation Company.

They deny that the Union Pacific Railroad Company is a common carrier of passengers or property, wholly or at all, by railroad between various points in Utah or Colorado or Wyoming or Kansas or Nebraska and any point or points in the State of Oregon, or that said Union Pacific Railroad Company has ever owned or operated or now owns or operates as a common carrier of passengers or property or otherwise or at all any railroad within the State of Oregon. They deny that the Union Pacific Railroad Company owns the entire capital

stock of the Oregon Short Line Railroad Company, or that it and the Oregon Short Line Railroad Company together own the entire capital stock of the Los Angeles & Salt Lake Railroad Company. They deny that the four corporations, to wit, Union Pacific Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, and Los Angeles & Salt Lake Railroad Company, are treated as one or that their operations or the statistics relating thereto are included in the report of the Union Pacific Railroad Company to the Interstate Commerce Commission or to the commissions or other governmental bodies, Federal or State, to
2765 which railroads currently report as required by law, but they admit that the Union Pacific Railroad Company directly and indirectly by stock ownership in and through the other railroad companies, last above referred to, controls the said other companies referred to as Union Pacific system companies and that said four companies together consitute the Union Pacific system and that the railroads comprising said system are under common control and management and are operated as a single system, but they deny that they are operated as a unit.

II

Answering Paragraph III of the complaint these answering defendants deny that the defendant railroad companies named in Paragraph II of said complaint provide in substance the service of transportation of passengers or property performed by common carriers within the boundaries of the State of Oregon either in interstate or intrastate commerce, or that either the Union Pacific Railroad Company or the Los Angeles & Salt Lake Railroad Company have or do perform any transportation service of passengers or property as common carriers or otherwise within the State of Oregon, nor has, nor does, either of said last named companies originate any part of the passenger or freight traffic moving from points within the State of Oregon in intrastate or interstate commerce.

III

For answer to Paragraph IV of the complaint these answering defendants deny that they have failed or refused, or still
2766 fail or refuse, to provide a very large area or any area in central Oregon with adequate or reasonable facilities of transportation by railroad or that the line of railroad from Ontario, Oregon, to Crane or to Harriman, Oregon, is a part of a line of railroad projected many years ago by the Union Pacific system to extend from Ontario in a westerly direction across the State to a connection at some suitable point in western Oregon with the Southern Pacific Company; deny that between (a) Crane or Harriman in eastern Oregon and (b) Crescent Lake or some point in the vicinity thereof on the existing line of railroad operated by the Southern Pacific Company and commonly known as the Natron cutoff, there is any practicable or feasible route for the construction of

a line of railroad which, when built, would provide such facilities; deny that adequate provision, without delay, of such facilities is demanded by public interest or convenience or necessity; but allege the fact to be that said route proposed in said Paragraph IV of said complaint traverses for nearly its entire distance, 175 miles more or less, a desert country officially and commonly characterized and known as the Great High Desert, and that the area tributary to said route on either side thereof is for nearly the entire distance barren of production and affords no present or prospective possibility of traffic for the support of said proposed line of railroad.

2767 Defendants deny that the expense involved in the extension of lines aforesaid will not impair the ability of the defendants, or any of them, to perform their duty to the public.

IV

In answer to Paragraph V of the complaint these answering defendants deny that in consequence of the failure or refusal of the defendants, or some of them, to build or operate a line of railroad through or across central Oregon as alleged in the complaint the development of a vast area of territory is prevented or rendered virtually impossible or that the natural resources of such undeveloped area or its possibility for producing traffic for a railroad across the State are rendered of little or no value or that such possibilities are extensive or substantial, or that much or any of the freight or passenger traffic, either intrastate or interstate, handled by the defendants from or to points in Oregon must traverse unduly or unreasonably circuitous routes or that much or any money or time is lost to the shipping or traveling public through being compelled to use those circuitous routes or to pay rates or fares based on the distances thereover, or that opportunity is lost for effecting largely increased economy or efficiency in handling the lumber of the Willamette Valley moving to eastern destinations or that the products of Oregon in considerable or any substantial part are subjected to excessive or unreasonable delay

2768 in reaching the principal seaports or consuming markets of the State, or that the severity of car shortages in Oregon recurring periodically in the past or the losses therefrom suffered by shippers have been augmented needlessly or unreasonably or so will continue to be until the extension of lines sought in the complaint has been made, or that interior Oregon is denied benefits of reasonable competition between the defendants in the matter of the services or facilities of transportation due to be accorded by them, or is deprived of adequate outlets of its products in California or in western Oregon.

V

In answer to Paragraph VI of the complaint these answering defendants deny that the construction or operation of a line of railroad from Crane or Harriman westward to a connection with the Southern

Pacific Company's rails at Crescent Lake or some point near thereto or the establishment between defendants or the projected line of railroad, of through routes or joint rates or divisions thereof are necessary or desirable in the public interest, or that such joint or common use of the projected line should be prescribed as may be just or reasonable or as will afford adequate service or will maintain or assure maximum competition or the most efficient use of cars, equipment, or facilities; deny that the alleged extension sought in the complaint is reasonably or at all required in the interest of public conve-
2769 nience or necessity or that the expense involved therein will not impair the ability of the defendants, or any of them to perform their duty to the public.

VI

For answer to Paragraph VIII of the complaint these answering defendants deny that by reason of the facts alleged in the complaint or otherwise, the defendants, or any of them, unlawfully or in violation of sections 1 or 15 or 15a of the interstate commerce act have failed or refused, or still fail or refuse, to give due consideration to the transportation needs of the State of Oregon or to the necessity under honest, efficient, or economical management of enlarging their existing transportation facilities in order to provide the people of the State of Oregon with adequate transportation or to that end to extend their lines or to operate the same substantially as demanded in the complaint.

For their first, further, and separate answer and defense to the complaint herein these answering defendants allege:

I

That during the year 1905 the interests by which the properties comprising the then so-called Union Pacific system and the properties then comprising the so-called Southern Pacific lines were then controlled, caused to be organized under the laws of the State of Oregon a corporation designated and known as "Oregon Eastern Rail-
2770 way Company." That said company was incorporated with power to construct, maintain, and operate a line of railroad across the State of Oregon from Natron, near Eugene, Oregon, to Ontario, Oregon, with lines radiating therefrom as follows:

South to Klamath Falls, Oregon, north to Agency Plains in the Deschutes Canyon in Oregon, and a third line from said main line south to Lakeview, Oregon.

That said Oregon Eastern Railway Company completed its surveys on said route and by amending its articles of incorporation to authorize it so to do acquired the then constructed line of railroad from Weed, California, to Klamath Falls, Oregon, and proceeded with the construction north from said Klamath Falls toward a junction with said proposed cross-State line at or near Odell, Oregon. It also proceeded with construction south from Natron, Oregon, toward said Odell, and the line from Ontario to Vale having been constructed on

said cross-State route, it proceeded with construction west from Vale, Oregon, through the Malheur Canyon and into the Harney Valley in Oregon.

That said construction proceeded, but not without some interruptions, until the year 1910 when the defendant Oregon-Washington Railroad & Navigation Company was organized and thereupon the rights of way acquired and the lines constructed east and north of Odell were conveyed to said Oregon-Washington Railroad &
2771 Navigation Company, except the line in the Deschutes Canyon which had been constructed in the meantime by the defendant Des Chutes Railroad Company. That upon its completion the said line in the Deschutes Canyon was leased by said Des Chutes Railroad Company to said defendant Oregon-Washington Railroad & Navigation Company and the same has been operated by said lessee ever since. That the line from Natron, Oregon, south and the line from Weed, California, north through Klamath Falls, Oregon, to a connection with the line south from Natron were conveyed by said Oregon Eastern Railway Company to the Central Pacific Railway Company.

That after said conveyances were made as aforesaid and in the month of December, 1912, Union Pacific Railroad Company, by decision of the Supreme Court of the United States, was directed to divest itself of the control of the Southern Pacific Company and by reason of the control of the Central Pacific Railway Company by the Southern Pacific Company said Supreme Court's decision resulted in cutting the route into Natron, Oregon, from Ontario, Oregon, at Odell Junction and prevented said Oregon-Washington Railroad & Navigation Company from reaching its terminal at Portland, Oregon, by said route.

That the construction of said Central Pacific line of railroad from Natron, Oregon, through Klamath Falls to Weed, California, has been completed by said Central Pacific Railway Company and the same has been, since completed, and is being operated by the
2772 defendant Southern Pacific Company. That upon the rendition of the said decision of said Supreme Court of the United States as aforesaid the said defendant Oregon-Washington Railroad & Navigation Company completed its line of railroad into the Harney Valley in Oregon and has since extended the same to Crane and later to Burns, the county seat of Harney County, Oregon. That the defendant Oregon Short Line Railroad Company has operated and is operating the said line of railroad from Ontario to Burns under lease from said defendant Oregon-Washington Railroad & Navigation Company and that said line of railroad westerly from Ontario has been unprofitable from the beginning and the gross revenues from the operation of said line have been at all times insufficient to meet the operating expenses and taxes on said line, and the operation thereof has resulted in deficits amounting to hundreds of thousands of dollars.

II

These answering defendants allege that the said proposed line of railroad on said cross-State survey from Crane or Harriman to Crescent Lake traverses an area of unproductive country with no substantial or potential tonnage tributary thereto to sustain said line if constructed and that said line so extended would involve an initial expenditure of some eight millions of dollars in addition to the investment already made in the Ontario-Burns line, and said proposed construction is not reasonably required in the interests
2773 of public convenience and necessity and would, if made, involve the Oregon-Washington Railroad & Navigation Company and the Oregon Short Line Railroad Company, if the latter operated the same, in such great expense and continuing loss that their ability to perform their duty to the public would be greatly impaired. That said proposed cross-State line if built to Crescent Lake or Odell or other near-by point of connection with the Central Pacific so-called Natron cut-off line, would terminate on the eastern slope of the Cascade Mountains some 325 miles, more or less, from its connection with the line of the Oregon Short Line Railroad Company at Ontario, Oregon, and with no possibility of connection on the west with the line or terminal of said Oregon-Washington Railroad & Navigation Company and that the same could not be operated to advantage or profit of either the public or of these answering defendants, or any of them.

III

That the line of railroad proposed by the complaint herein would, if constructed, be and constitute a branch line from the constructed and operated railroad of the defendant Oregon-Washington Railroad & Navigation Company extending from Ontario to Burns, if constructed by said Oregon-Washington Railroad & Navigation Company; and if constructed by the Central Pacific Railway Company the same would constitute a branch line built from the so-called
2774 Natron cut-off of said Central Pacific Company and the same would not and does not constitute an extension from the Ontario-Burns line or an extension from the said Natron-Weed line of the defendant Central Pacific Railway Company.

For their second, further and separate answer to the complaint herein these answering defendants allege that if paragraphs 21 and/or 4 of section 1 or paragraph 3 of section 15 or paragraphs 3 or 4 of section 15a of the "interstate commerce act" be construed and/or applied as conferring upon this commission authority to require these answering defendants, or any of them, to construct, maintain, or operate the line of railroad petitioned for in the complaint herein, then the said provisions of said act, and particularly the portion thereof relative to extension of lines of railroad, is unconstitutional and void in that the same would operate to deprive these answering defendants, or such of them, as may be ordered to construct said proposed line of railroad, of their or its property without due process of

law, and to take from these answering defendants or such of them as may be ordered by this commission to construct said proposed line of railroad, their private property for public use without just compensation, all in violation of the 5th amendment to the Constitution of the United States of America.

Wherefore these answering defendants pray that the com-
2775 plaint herein be dismissed and the relief therein prayed for, or any relief, be denied.

Interstate Commerce Commission, Washington

I, George B. McGinty, secretary of the interstate commerce commission, do hereby certify that the attached are true copies of the following:

Answer of defendants, Spokane, Portland and Seattle Railway Company, Oregon Trunk Railway and Oregon Electric Railway Company filed June 28, 1927,

Answer of Great Northern Railway Company filed June 30, 1927,

Answer of Central Pacific Railway Company and Southern Pacific Company, filed July 5, 1927, and

Answer of Northern Pacific Railway Company filed July 8, 1927,

in case No. 19680, Public Service Commission of Oregon v. Central Pacific Railway Company et al., the originals of which are now on file and of record in the office of this commission.

In witness whereof I have hereunto set my hand and affixed the seal of said commission this 21st day of August, A. D. 1930.

[SEAL] GEORGE B. MCGINTY,
Secretary of the Interstate Commerce Commission.

U. S. District Court, District of Oregon. Filed Sept. 29, 1930. G. H. Marsh, clerk, by H. L. Kenyon, deputy.

2777 Before the Interstate Commerce Commission

Docket No. 19680

Filed June 28, 1927, Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT

vs.

CENTRAL PACIFIC RAILWAY COMPANY ET AL., DEFENDANTS.

ANSWER OF DEFENDANTS, SPOKANE, PORTLAND AND SEATTLE RAILWAY COMPANY, OREGON TRUNK RAILWAY, AND OREGON ELECTRIC RAILWAY COMPANY

Now come defendants, Spokane, Portland and Seattle Railway Company, Oregon Trunk Railway, and Oregon Electric Railway Company, and for their answer to the complaint herein deny that the construction and operation of the proposed line of railroad described in the complaint are necessary or desirable in the public interest and deny that such construction and operation are reasonably required in the interest of public convenience and necessity, and defendants allege that the expense involved therein would impair the ability of the defendants to perform their duty to the public.

For their further answer these defendants allege that the territory described in the complaint as not served with facilities of transportation by railroad is not territory which these defendants, or any of them, have ever undertaken to serve and the proposed line of railroad as described in the complaint would not be an extension of any line of railroad of any of these defendants. These defendants therefore are not willing to construct or to participate in the construction of any of the proposed lines of railroad as described in the complaint.

2778 Wherefore these defendants pray that the complaint herein be dismissed.

SPOKANE, PORTLAND AND SEATTLE RAILWAY COMPANY,
OREGON TRUNK RAILWAY,
OREGON ELECTRIC RAILWAY COMPANY,
By CAREY DEW,
C. A. HART,
Their attorneys.

2779 Before the Interstate Commerce Commission

I. C. C. docket No. 19680

Filed June 30, 1927, Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT

vs.

CENTRAL PACIFIC RAILWAY COMPANY ET AL., DEFENDANTS

ANSWER OF GREAT NORTHERN RAILWAY COMPANY

Comes now the Great Northern Railway Company, one of the defendants above named, and for its answer to the complaint herein denies each and every allegation contained in paragraphs 4, 5, 6, and 8 and admits the allegations contained in paragraphs 1, 2, 3, and 7.

Answering further, this defendant states that the Great Northern Railway Company now has no lines in the State of Oregon except the portion of its line extending from Portland, Oregon, to Seattle, Washington. This defendant has filed an application with the Interstate Commerce Commission for permission to operate over the lines of the Spokane, Portland & Seattle Railway, the Oregon Trunk Railway, and the Des Chutes Railroad from Spokane through Wishram, Washington, and up the Deschutes River to Bend, and also for permission to acquire or construct and operate a line from Bend to a connection with the Southern Pacific at Paunina and to operate thence over the Southern Pacific Railway's line to Klamath Falls. This defendant expects to acquire one-half of the stock of the Oregon, California & Eastern Railway operating from Klamath Falls to Sprague River Landing. Except as above stated the Great Northern Railway Company does not now own and does not expect to own, acquire, or operate any railroads in Oregon or any line of railroad entering Oregon via the route described in the complaint. The only
2780 logical and direct route into Oregon for this defendant is through Spokane and down the Columbia River and up the Deschutes River. The Great Northern Railway Company is not willing to construct or participate in the construction, maintenance, or operation of the proposed line of railway referred to in the complaint.

The construction of said proposed railroad by the Great Northern Railway Company is not reasonably required in the interest of the public convenience and necessity, and the expense incident to such construction would impair the ability of this defendant to perform its duty to the public now served by its lines.

Wherefore, having fully answered, defendant Great Northern Railway Company prays that the complaint be dismissed.

F. G. DORETY,
R. J. HAGMAN,
Attorneys for defendant Great Northern Railway Company,
1120 Great Northern Ry. Building, Saint Paul, Minnesota.

Dated June 26, 1927.

2781 Before the Interstate Commerce Commission

Docket No. 19680

Filed July 5, 1927, Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT

vs.

CENTRAL PACIFIC RAILWAY COMPANY ET AL., DEFENDANTS

ANSWER OF CENTRAL PACIFIC RAILWAY COMPANY AND SOUTHERN PACIFIC COMPANY

Central Pacific Railway Company and Southern Pacific Company for their answer to the complaint herein, admit, deny and allege as follows, to wit:

I

With respect to the allegations set forth in Paragraph III of the complaint these defendants admit that the defendants names in this proceeding perform as common carriers the substantial part of the interstate and intrastate commerce furnished within and to and from the State of Oregon.

II

With respect to the allegations set forth in Paragraph IV of the complaint these defendants deny each and every allegation thereof, and in relation thereto these defendants state that although
2782 there is a large area in Central Oregon not served by railroad, there is no public interest, convenience or necessity to be served by the construction of a line of railroad into or over such area.

III

With respect to the allegations set forth in Paragraphs V, VI, VII, and VIII of the complaint these defendants deny each and every allegation therein contained.

As a further and separate defense to the complaint herein, these defendants allege:

IV

That there is no authority in law for the granting of the relief prayed for in the complaint herein; that if paragraph 21 of section 1 of the act to regulate commerce, as amended, or if any other paragraph or provision of the act to regulate commerce, to which reference is made in said complaint, be construed separately or together as conferring upon the Interstate Commerce Commission authority to require these defendants or either of them to construct or join in the construction of the line of railroad mentioned in and proposed by the complaint herein, or to construct, maintain or operate said line of

railroad described and petitioned for in said complaint, these defendants allege that said provision or provisions of said act, and
2783 particularly the provision thereof relative to the extension of lines of railroad, is unconstitutional and void in that the same would operated to deprive these defendants and each of them of their property without due process of law, and take from these defendants and each of them their private property for public use without just compensation, all in violation of the fifth amendment to the Constitution of the United States.

Wherefore, these defendants, Central Pacific Railway Company and Southern Pacific Company, pray that the complaint herein be dismissed, and that no relief be granted to the complainant as prayed for or otherwise.

GUY V. SHOUP,
J. R. BELL,
BEN C. DEY,
Attorneys for defendants, Central Pacific Railway Company and Southern Pacific Company.

Filed July 8, 1927, Interstate Commerce Commission

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT

vs.

CENTRAL PACIFIC RAILWAY COMPANY, DES CHUTES RAILROAD Company, Great Northern Railway Company, Northern Pacific Railway Company, Oregon Electric Railway Company, Oregon Short Line Railroad Company, Oregon Trunk Railway, Oregon-Washington Railroad & Navigation Company, Southern Pacific Company, Spokane, Portland & Seattle Railway Company, and Union Pacific Railroad Company, defendants

ANSWER OF NORTHERN PACIFIC RAILWAY COMPANY

Now comes the Northern Pacific Railway Company and for its answer to the complaint of the complainant herein, admits the allegations contained in paragraphs Numbered I, II, and III of the complaint.

Defendant, Northern Pacific Railway Company, specifically denies that the construction and operation of the proposed line of railroad described in the complaint are necessary or desirable in the public interest, and specifically denies that such a construction and operation are reasonably required in the interest of public convenience and necessity; and this defendant alleges that the expense involved in such construction and operation would impair its ability to perform its duties to the public.

2785 Except as herein specifically admitted, this defendant denies each and every allegation contained in the complaint.

NORTHERN PACIFIC RAILWAY COMPANY,

Construction of railroad lines in eastern Oregon

No. 14392 [1]

PUBLIC SERVICE COMMISSION OF OREGON

v.

CENTRAL PACIFIC RAILWAY COMPANY ET AL.

Submitted February 5, 1926. Decided May 3, 1926

U. S. District Court, District of Oregon. Filed Sept. 29, 1930, G. H. Marsh, clerk, by H. L. Kenyon, Deputy.

1. Complaint of the Public Service Commission of Oregon seeking an order or orders under paragraph (21) of section 1 of the act, requiring construction and operation of various lines of railway in the interior portion of the State of Oregon, dismissed.

2. Certificate issued conditionally authorizing the Oregon, California & Eastern Railway Company to construct certain lines of railroad in Klamath and Lake Counties, Oreg.

3. Acquisition by the Southern Pacific Company of control of the Oregon, California & Eastern Railway Company by purchase of capital stock, conditionally approved and authorized.

4. Certificate issued conditionally authorizing the Oregon Trunk Railway to construct and operate a line of railroad in Des Chutes and Klamath Counties, Oreg.

5. Certificates issued authorizing the Central Pacific Railway Company to construct a line of railroad in Klamath County, Oreg., and Modoc County, Calif.

6. Acquisition by the Southern Pacific Company of control of the Nevada-California-Oregon Railway by purchase of capital stock, approved and authorized.

7. Authority for permission to retain excess earnings denied

[1] This report also embraces finance docket No. 4730, construction of lines by Oregon, California & Eastern Railway Company; finance docket No. 4810, construction of lines by Oregon Trunk Railway; Finance docket No. 4914, construction of line by Central Pacific Railway Company in Klamath County, Oreg., and Modoc County, Calif.; finance docket No. 5111, construction of line by Central Pacific Railway Company in Modoc County, Calif.; finance docket No. 4924, acquisition of control of Nevada-California-Oregon Railway Company by Southern Pacific Company; and finance docket No. 4941, acquisition of control of Oregon, California & Eastern Railway Company by Southern Pacific Company.

2787 Appearances in No. 14392.

I. H. Van Winkle, attorney general, J. M. Devers and Wm. P. Ellis, assistant attorneys general, and J. W. McCulloch for complainant.

Fred C. Graves and Samuel L. Newton for Public Utilities Commission of Idaho; and Hugh Gordon for Railroad Commission of the State of California, interveners.

J. W. McCulloch for Central Oregon Development League, R. S. Hamilton for Bend (Oreg.) Commercial Club, A. R. Bowman for Crook County (Oreg.) Chamber of Commerce, Joseph N. Teal and William C. McCulloch for Portland (Oreg.) Chamber of Commerce, J. T. Brand for city of Marshfield (Oreg.), Marshfield Chamber of Commerce and North Bend (Oreg.) Chamber of Commerce, and Seth Mann for San Francisco (Calif.) Chamber of Commerce and Oakland (Calif.) Chamber of Commerce, interveners.

Ben C. Dey and Paul P. Farrens for Central Pacific Railway Company and Southern Pacific Company, Arthur C. Spencer, J. V. Lyle and H. A. Scandrett for Union Pacific System, and Carey & Kerr and Charles A. Hart for Oregon Trunk Railway, defendants.

Appearances in F. D. Nos. 4730, 4810, 4914, 4924, and 4941.

Wm. F. Herrin, J. R. Bell, E. J. Foulds, and Ben C. Dey for Central Pacific Railway Company and Southern Pacific Company.

Carey & Kerr and Charles A. Hart for Oregon Trunk Railway.

R. C. Groesbeck, Wilson & Reilly, and James G. Wilson for Oregon, California & Eastern Railway Company.

I. H. Van Winkle, attorney general, and J. M. Devers and Wm. P. Ellis, assistant attorneys general, for Public Service Commission of Oregon.

Charles Moran and A. B. Roehl for Nevada-California-Oregon Railway.

J. T. Shaughnessy for Public Service Commission of Nevada and Reno (Nev.) Chamber of Commerce.

Carl I. Wheat for Railroad Commission of California.

Joseph N. Teal and William C. McCulloch for Portland Chamber of Commerce and Portland Traffic and Transportation Association.

R. L. Shepherd for Oregon City Chamber of Commerce and Hawley Pulp & Paper Company.

Arthur D. Hay, district attorney, for Lake County, Oreg.

E. A. LaRue for Order of Railway Conductors.

G. W. Burbank for Brotherhood of Locomotive Engineers.

J. A. Ford for Brotherhood of Locomotive Firemen.

Appearances in F. D. No. 5111.

J. R. Bell and J. I. King for Central Pacific Railway Company.

Report of the commission

Aitchison, commissioner.

In a broad way, the proceedings dealt with in this report require our answer as to the railroad facilities which shall be afforded eastern Oregon and northern California, and as to whether in the construction

of additional railroad lines needed to serve that territory—possibly the largest area of the country remaining without rail mileage—
the principle of maintaining competition between carriers
2788 shall be observed, or the policy of creating zones of influence
so that the field shall be preserved for intensive cultivation by one rail carrier under appropriate conditions and reservations. A number of proceedings on our dockets must be given common consideration to permit as comprehensive a view of the situation as the nature of the subject matter and the importance of the determination require. Although these proceedings were not all heard together, they may for convenience be disposed of in this report. While portions of northern California are embraced in the pending proceedings, the greater portion of the territory involved is within the State of Oregon, east of the Cascade Mountains, and references to places or sections will be considered as within Oregon unless the fact is otherwise made to appear.

Statement of the issues

The Oregon commission case.

In the complaint in No. 14392, filed October 30, 1922, the Public Service Commission of Oregon, proceeding under paragraph (21) of section 1 of the interstate commerce act, alleges that public convenience and necessity demand the construction of adequate and efficient railroads between certain parts of Oregon for the transportation of freight and passengers. It asserts that the expense of construction of such roads will not impair the ability of defendants to perform their duties to the public.[2] The Oregon commission asks us to require defendants, or some one or more of them, to extend and construct a railroad from Crane westward to Oakridge to connect with roads that will afford the territory thus traversed market outlets in western Oregon and California; also to extend and construct connections between the railroad terminals at Bend and Kirk, and a branch line to Lakeview. It asks that these projected lines be afforded such joint and common use of existing railroads as will justify the desired construction and adequately serve the districts concerned, and that these railroads be so grouped and such joint and common use ordered as will maintain and assure maximum competition and the most efficient use of cars, equipment and facilities.

Various Oregon municipalities and commercial organizations, and the Public Utilities Commission of Idaho, the Railroad Commission of California and the Chambers of Commerce of San Francisco and Oakland, Calif., intervened and were heard in general support of the complaint.

[2] The defendants in the complaint are Central Pacific Railway Company, the Southern Pacific Company, the Oregon-Washington Railroad & Navigation Company, the Oregon Short Line Railroad Company, the Oregon Trunk Railway, and the Des Chutes Railroad Company. The Union Pacific Railroad Company, Oregon Electric Railway Company, and Spokane, Portland & Seattle Railway Company were afterwards made defendants.

Hearing was held upon this complaint, and a report proposed by the examiner was served upon the parties, in which it was proposed to grant a large measure of the relief sought. Exceptions were filed by defendants, and answer by complainant. The case was submitted on briefs and oral argument March 28, 1925, but the filing soon thereafter of the various applications hereinafter discussed has led us to withhold a decision until the whole matter could be determined. What these applications propose is largely in substitution for the proposals of the Oregon commission, so far as meeting local needs is concerned.

2789 Finance docket No. 4730. The Oregon, California & Eastern Railway Company, frequently referred to as the "Strahorn Railroad," owns and operates in Klamath County a line of railroad approximately 40 miles long, extending from Klamath Falls eastward and northeastward to Sprague River.

By application filed March 26, 1925, pursuant to the provisions of paragraphs (18) to (21) of section 1 of the act, the Oregon, California & Eastern seeks a certificate of public convenience and necessity authorizing it to construct three branches, from the northerly terminus at Sprague River, as follows: (1) Northerly 63 miles to Silver Lake, in Lake County, Oreg.; (2) from a point on the proposed Silver Lake branch approximately 20 miles north of Sprague River, northwesterly along the Williamson River approximately 15 miles, in Klamath County; (3) from Sprague River southeasterly approximately 65 miles to Lakeview.

Finance docket No. 4941. The Southern Pacific Company, under the provisions of paragraph (2) of section 5 of the act, filed application for authority to acquire control by stock ownership of the Oregon, California & Eastern Railway Company. This application was made pursuant to a contract executed February 3, 1925, between the Southern Pacific Company and Robert E. Strahorn. Following the execution of the contract and in accordance with the terms thereof, the Southern Pacific acquired and now owns slightly less than a majority of the capital stock and all of the outstanding first mortgage bonds of the Oregon, California & Eastern. Approval of the purchase of the balance of the stock is now sought by the Southern Pacific.

Finance dockets Nos. 4914 and 5111. In the earlier of these proceedings, the Central Pacific Railway Company by application filed June 20, 1925, seeks a certificate of public convenience and necessity authorizing the construction of a line of railroad from a point on its existing line 2.2 miles south of Klamath Falls, southeasterly to Cornell, Modoc County, Calif., 36 miles. On October 2, 1925, but not in time for assignment and consolidation with the above-mentioned applications, the Central Pacific Railway Company filed an application, finance docket No. 5111, for a certificate authorizing the construction of 62.1 additional miles of railroad forming an extension of the proposed Klamath Falls-Cornell line. This added mileage extends from Cornell southeasterly to Alturas, Modoc County, Calif., a city located on the Nevada-California-Oregon Railway. All the essential facts with respect to No. 5111 have been covered by evidence

in the present record, and have been discussed in argument. No one requests a separate hearing. The proposed construction involved forms a continuous line of railroad from a point on the existing line of the Central Pacific near Klamath Falls, through Cornell to Alturas. It is an essential part of the general plan, and will be dealt with in this report.

Finance docket No. 4924. The Southern Pacific Company, under the provisions of paragraph (2) of section 5 of the act, applies for authority to acquire control by stock ownership of the Nevada-California-Oregon Railway, a Nevada corporation, owning and operating a narrow-gauge railroad 154.63 miles in length extending from Lakeview southerly through Alturas, Calif., to a point of connection with the Fernley branch of the Central Pacific (operated as a part of Southern Pacific system) at Wendel, Lassen County Calif. The application was filed pursuant to a contract executed April 30, 1925,
2790 by the Southern Pacific and Charles Moran, representing the owners of all the capital stock and bonds of Nevada-California-Oregon.

Finance docket No. 4810. The Oregon Trunk Railway, a Washington corporation, whose capital stock is owned by the Spokane, Portland & Seattle Railway Company, whose stock in turn is owned equally by the Great Northern Railway Company and the Northern Pacific Railway Company, now owns and operates a railroad extending from Fallbridge, Wash., on the north bank of the Columbia River, southerly along the Deschutes River a distance of about 151 miles to Bend, Deschutes County, Oreg. By application filed May 5, 1925, the Oregon Trunk requests a certificate of public convenience and necessity, authorizing the construction of an extension of its existing line from Bend in a southwesterly direction a distance of 66 miles to a point near Paunina, a station on the recently constructed portion of the Natron cut-off line of the Central Pacific, and thence southeasterly across Klamath Marsh and along the Williamson River to Sprague River, approximately 70 miles, and thence south and west approximately 42 miles to Klamath Falls, making a total extension of 178 miles from Bend.

The Southern Pacific, the Central Pacific, and the Oregon, California & Eastern oppose the Oregon Trunk's application.

Between Black Butte, near Weed, and Grass Lake, Calif., there is in progress certain new construction authorized by us October 8, 1925, known as the "Black Butte cut-off." Construction of Black Butte cut-off by C. P. Ry., 99 I. C. C. 780.

By consent, the finance docket applications, other than No. 5111, were consolidated for hearing and argument. The public service and railroad commissions of Oregon, California, and Nevada intervened, as did various civic organizations.

The Oregon commission does not oppose the plans of the railway companies except so far as they may be considered a substitute for the proposed cross-State line between the Natron cut-off and the connection with the Oregon Short Line at Crane or Harriman. The

route between western Oregon and eastern territory by way of Crane would be more than 200 miles shorter than that of the Southern Pacific after completion of the proposed line of the latter between Klamath Falls and Wendel. Shipping interests of southern Idaho join in the request for a cross-State line in Oregon, to afford them more direct communication with California. The Southern Pacific opposes the plan of the Oregon Trunk for a line to Klamath Basin on the ground that it would be an unnecessary duplication of facilities; that it is in position to serve the Klamath Basin adequately with its own lines; and that the amount of tonnage now tributary to the Oregon Trunk is approximately as great as that tributary to the Southern Pacific in southern Oregon, including the lines of the Oregon, California & Eastern. It cites the report in construction of Natron cut-off by Central Pacific Ry., 82 I. C. C. 185, which states that one of the principal purposes of the new line was to serve the local territory. The Oregon Trunk represents that the Southern Pacific, with its proposed control of the Oregon, California & Eastern and Nevada-California-Oregon, will monopolize about 70 per cent of the timber tonnage east of the Cascades, in addition to its well-known predominating influence in the much more important traffic territory west of the Cascades; and that the public interest, as well as the requirements of the northern lines for additional tonnage, justifies the construction of its proposed line to Klamath Falls.

2791 The Railroad Commission of California expresses its desire that the Southern Pacific shall acquire control of the Nevada-California-Oregon, and that the Central Pacific shall build its proposed line from Klamath Falls to Alturas. The Public Service Commission of Nevada and the Reno Chamber of Commerce support the applications of the Southern Pacific and Central Pacific, as advantageous to the people of Nevada.

Four transcontinental railroad systems are directly concerned with the issues before us. (1) The Union Pacific system, as is generally known, includes, through stock and bond ownership, the Oregon Short Line Railroad Company and the Oregon-Washington Railroad & Navigation Company, formerly the Oregon Railroad & Navigation Company. Its main lines run through the States of Nebraska, Kansas, Colorado, Wyoming, Utah, Idaho, Oregon, and Washington, from the Missouri River to the north-coast Pacific ocean ports. Generally, the course of the Union Pacific may be described as lying in the tier of States second from the Canadian boundary. The Des Chutes Railroad is a subsidiary of the Oregon-Washington, and operates from the Columbia River to Bend. For the purposes of this report we need not consider the Salt Lake-Los Angeles line of the Union Pacific. (2) The Southern Pacific Company, with its two great main lines for transcontinental traffic: The Sunset route through El Paso to San Francisco Bay; and the Ogden route, or the Central Pacific line, from Ogden to San Francisco Bay; which lines generally may be described as occupying states still further south than the Union Pacific, or else in prolongation of the Union Pacific. A third

main line, the Shasta route, extends northerly from San Francisco Bay to Portland, and there connects with the Union Pacific and the Northern lines. (3) The Northern Pacific Railway Company and (4) the Great Northern Railway Company occupy the northern tier of States westward from the Mississippi River at St. Paul and Minneapolis, Minn., to the ports upon Puget Sound. A jointly owned line, the Spokane, Portland & Seattle Railway, gives access from the main lines of the Northern lines to Portland and Astoria; and subsidiaries, the Oregon Electric Railway and Oregon Trunk Railway, penetrate the Willamette and Des Chutes Valleys, respectively

A large portion of central and eastern Oregon, northern California, and northern Nevada, remains without railroad transportation. This territory may roughly be described as a triangle with its base extending from Sacramento, Calif., to Portland, with Salt Lake City, Utah, at its apex. Railroad development of the area has been by way of blunting the angles of the triangle, or trimming off its sides, rather than by penetration of its interior.

In consolidations and combinations of carriers, decided July 11, 1907, 12 I. C. C. 277, a proceeding of investigation to which the Union Pacific and Southern Pacific were respondents, we considered, inter alia, the then existing relations between those companies, at the time under common control, and their relations with the subsidiaries of the former carrier, the Oregon Railroad & Navigation Company and Oregon Short Line Railroad Company. A map found at p. 279 of that report will show the then existing rail lines of the Union Pacific and Southern Pacific systems, and will show the undeveloped triangle to which we have referred. In the course of that report, we said (p. 286):

2792 In no other portion of the country is the Federal Government expending such large sums for purposes of development as in this great western region tributary to the Union Pacific and the Southern Pacific, and in no other part of the United States is the commerce of the country dependent upon so few railways covering so vast a territory and controlled by so few men; and in no part of the United States could such control have such far-reaching effect.

We concluded, among other (p. 304):

(1) * * * The credit of a railway company is founded upon the resources and prosperity of the country through which it runs. Its surplus funds and credit should be used for the betterment of its lines and in extensions and branches to develop the country contiguous to it. The testimony taken upon this hearing shows that about 50,000 square miles of territory in the State of Oregon, surrounded by the lines of the Oregon Short Line Railroad Company, the Oregon Railroad & Navigation Company, and the Southern Pacific Company, is not developed; while the funds of those companies which could be used for that purpose are being invested in stocks like the New York Central and other lines having only a remote relation to the territory in which the Union Pacific system is located.

Thereafter important changes in the situation were made during a series of years. The common control of the Union Pacific and Southern Pacific systems was terminated. See United States *v.* Union Pacific R. R. Co., 226 U. S. 61, 470. The District Court of the United States for the District of Utah entered its decree dismissing the complaint of the United States intended to sever the lines of the Southern Pacific Company and those of the Central Pacific Railway Company, then held under lease and control by stock ownership by the former company. United States *v.* Southern Pacific Co., 239 Fed. 998. On appeal to the United States Supreme Court, the decree of the District Court was reversed, and the Supreme Court directed that a decree be entered severing the control by the Southern Pacific of the Central Pacific by stock ownership or by lease. United States *v.* Southern Pacific Co., 259 U. S. 214. However, prior to the entry of the decree, in a proceeding pending before us under paragraph (2) of section 5 of the act, which had been enacted subsequent to the decree of dismissal in the District Court, we authorized acquisition of control by the Southern Pacific Company of the Central Pacific Company, by lease and stock ownership, upon certain terms and conditions. Control of Central Pacific by Southern Pacific, 76 I. C. C. 508. It is unnecessary to detail the facts shown in the opinions and reports cited, although they are appropriate for consideration in certain aspects of the proceedings before us. They are part of the history of the country, generally understood, and we mention them to show they have not been overlooked. In consequence, the Union Pacific and Southern Pacific, the latter embracing the Central Pacific lines, are now to be taken as competitors, and their control is separate.

Before the union of the two systems under one control was dissolved, certain important and far-reaching plans were devised, and in
2793 part executed, which if consummated, would have avoided the criticism contained in our report in consolidations and combinations of carriers, supra, and would doubtless have resulted in none of these proceedings being now before us. A number of important branch and feeder lines were constructed in Oregon, Idaho, and in California. Certain new construction of an important character was projected which would have served to create new main lines by the Union Pacific system: (a) A watergrade line from Blakes, near Huntington, down the Snake River to a connection at Lewiston, Idaho, with existing water-grade lines down the Snake and Columbia Rivers to tidewater. This line was completed to Homestead, about 58 miles, where construction stopped. (b) A line from Ontario to a point near Odell Lake. A part of this line was constructed by the Oregon-Washington and is operated by the Oregon Short Line. The constructed portion extends from the Snake River at Malheur Junction 2 miles south of Ontario, up the course of the Malheur River 124 miles to Crane, at the entrance of Harney Valley. We authorized the construction of a branch therefrom to Burns, in construction of extension by O.-W. R. R. & Nav. Co., 86 I. C. C. 264. Harriman, 4.5

miles west of Crane, while upon the Burns branch, is often taken in this record as if the end of the Malheur Valley branch. (c) A line from Weed, Calif., through Klamath Falls, northward and across the Cascade Mountains to a connection with the existing main line of the Southern Pacific Company, at Eugene, more particularly described later in this report. The project was undertaken by the Central Pacific and is commonly called the Natron cut-off. (d) A line to be constructed by the Des Chutes Railroad Company, one of the subsidiaries of the Union Pacific, from a connection with the main line of the Columbia River at the mouth of the Deschutes River, southerly, to a junction with the Natron cut-off, and also to join the east-and-west line from Ontario. The line was constructed as far as Bend, partly by the use of joint trackage, as will be shown.

Although not embraced within the territory directly involved, it is desirable to note that Coos Bay and Tillamook Bay were both connected with the main line of the Southern Pacific, and thereby access to the tidewater ports on those bays was given the territory served by the rail lines of that carrier, and access to the interior was afforded the products and imports of those ports.

Virtually coincidently with the dissolution of the common control of the Union Pacific and Southern Pacific systems and the institution of the suit to dissolve the control of the Central Pacific by the Southern Pacific, the development of the four projects first mentioned was halted at Homestead, Crane, Oakridge and Kirk, and Bend, respectively. The Union Pacific has no present plans for the extension of its lines beyond Homestead, Crane [or Harriman], or Bend, so far as the present record discloses. In construction of Natron cut-off by Central Pacific Ry., supra, decided August 15, 1923, division 4 authorized the construction by the Central Pacific of the uncompleted portion of the line between Oakridge and Kirk, and that project is now nearing completion.

In other important respects the transportation system has altered. To the lines serving California, the Western Pacific has been added; and the Union Pacific has now obtained direct access to terminals of its own in Puget Sound by trackage rights from Portland, jointly with the Northern Pacific and the Great Northern Railways. The coast
extension of the Chicago, Milwaukee & St. Paul has been com-
2794 pleted to the Puget Sound and Grays Harbor districts. More
important for present consideration: The Northern Pacific and Great Northern jointly acquired the Astoria & Columbia River Railroad from Portland to Astoria, and constructed a new line from Spokane by Pasco and the Columbia River route to Portland, through their subsidiary, Spokane, Portland & Seattle Railway. Through a subsidiary of the latter, the Oregon Electric Railway, which they acquired and extended, they now reach through Portland numerous Willamette Valley points as far south as Eugene and Corvallis. Another subsidiary, the Oregon Trunk Railway, was formed to build from a connection on the Columbia River south, up the Deschutes River, with the ultimate aim of extensions still further south, and with Cali-

fornia and her ports as a possible ultimate goal. A bitter building war ensued between the northern lines and the Union Pacific, then constructing its line to Bend, which finally was composed by the construction of certain joint track and with both lines stopping at Bend. See abandonment of part of line by Oregon Trunk, 72 I. C. C. 679, wherein division 4, on October 5, 1922, authorized the abandonment of certain portions of the Oregon Trunk's line, as further joint use of track with the Union Pacific had been arranged.

The independent lines of railway, not controlled by trunk lines, are small and unimportant. None of them are capable of development to serve central Oregon. The longest, existing at the time of our report in 1907, the Corvallis & Eastern, has since been absorbed by the Southern Pacific system. It was projected at an early day as an east-and-west line across Oregon, to follow the course later taken by the Union Pacific's branch from Ontario to Crane for a considerable distance, and thence a cross central Oregon and the Cascade Mountains, to a connection with a line which was constructed from near the foot of the western slope of the Cascades to Yaquina Bay. It was conceived on an ambitious scale, to operate with a steamer line from Yaquina Bay to San Francisco Bay. An inconsiderable amount of work was done on the eastern end, and the steamer line has long since disappeared while the line actually constructed now serves merely as branches for the Southern Pacific.

Another independent line of railway is an applicant before us in these proceedings, the Oregon, California & Eastern Railway Company, which in the last few years has built about 40 miles of track extending eastward and northeastward from Klamath Falls, terminating at the Sprague River.

The situation has thus markedly changed. The Puget Sound country, and interior Washington east thereof, have the added service afforded by the Milwaukee; interior Washington south of the sound has the service of the Union Pacific and the Great Northern, and the sound of the Union Pacific; Portland is reached from the East by the subsidiary of the Great Northern and Northern Pacific; San Francisco Bay has the added service of the Western Pacific. Into the great interior section described in our report in consolidations and combinations of carriers, supra, a number of lines of railway have been pushed toward the center, but none have crossed it. The area of the State of Oregon without rail transportation, estimated in 1907 as 50,000 square miles, has been reduced to about 33,000 square miles, which is approximately one-third the total area of the State but still remains the largest area in any of the United States not traversed by a railroad. This report deals with the
2795 attempt by the Oregon commission to secure the construction of an east-and-west line across the territory, and certain feeders, and the proposals of certain carriers for approval of their projects looking toward construction in this area.

On the other hand, the situation has remained the same as in 1907 in an important respect: South of Eugene, including the great

central plateau of Oregon and northern California and northern Nevada, a vast area is served only by the Southern Pacific and its affiliations and exclusive connections. We know of no other section of the United States of comparable area dependent upon a single rail carrier.

The Oregon Commission Complaint, No. 14392

While the Oregon commission seeks additional mileage for areas now inadequately supplied with railroads, its governing motive was to remedy the present rail situation by which the products of western Oregon reach eastern markets only by movement to the north and eastward over the lines of the Great Northern, Northern Pacific, or Chicago, Milwaukee & St. Paul, or by movement southward and eastward over the lines of the Southern Pacific and Union Pacific by way of Roseville, Calif., and Ogden, Utah, or the transcontinental lines still farther south. The proposed line between Oakridge and Crane would establish a route between western Oregon and Granger, Wyo., at least 420 miles shorter than the existing line of the Southern Pacific by way of Roseville and Ogden. This saving in distance would of course apply to all territory east of Granger reached by the route through that point. Similarly, the proposed connections between Bend, Kirk, and Lakeview, respectively, and the proposed cross-State line, in addition to their local value, were intended to be links in through routes to more distant territories. The Oregon commission also desires to increase the measure of competition between railroad carriers, both in eastern and western Oregon.

Two conditions must be satisfied before the issuance of an order such as the Oregon commission seeks, namely, (1) that the extensions are required in the public interest, and (2) that expenses incident thereto will not impair the ability of the affected carriers to perform their duties to the public. Cooke *v.* C. B. & Q. R. R. Co., 66 I. C. C. 452.

Some description of the territory involved is desirable, to serve as well in consideration of the finance applications. The territory equals the combined areas of Massachusetts, Connecticut, New Jersey, and Delaware. It is a plateau, more or less broken, at elevations that range between 4,100 and 4,700 feet above sea level with certain mountain ranges and peaks much higher. It is bounded on the east by the Blue, Cedar, and Stein's Mountains, and on the west by the Cascade Mountains. At the north it slopes steeply to elevations of between 100 and 300 feet at the Columbia River, and at the south extends into Nevada and California.

In the north, on the Blue Mountains and west, are large stands of western yellow pine timber, chiefly in forest reserves. In the center is a semi-arid region, roughly 75 miles each way, of waste land incapable of developing any substantial traffic, except the chemical

deposits of certain lakes. East and South of this waste area are productive districts and valleys, long noted for their produc-
2796 tion of live-stock. In the west, on the eastern slope of the Cascade Mountains, across the entire State, are vast stands of timber, chiefly yellow pine, and a number of agricultural areas capable of extensive development.

We have mentioned the penetration of this territory from the east by the branch of the Oregon-Washington, operated by the Oregon Short Line, from the Snake River to Harriman, 4.5 miles west of Crane, at the entrance of Harney Valley.

In the extreme south and about midway between the eastern and western boundaries of Oregon, at Lakeview is the northern terminus of the Nevada-California-Oregon, a narrow-gauge railroad operating through an agricultural and timber district from Wendel, Calif., on the Southern Pacific. It formerly reached the Western Pacific as well, but its line between Wendel and the Western Pacific connection has been abandoned so that the sole outlet for the carrier is the Southern Pacific. The Natron cut-off crosses the Cascades from Kirk, by Oakridge, to Eugene, is now approaching completion of construction by the Central Pacific, and will be operated under lease by the Southern Pacific to connect the Southern Pacific lines in western Oregon with the line through Klamath Falls to California.

Extension of the line of the Oregon-Washington from Crane to Burns is now proposed from Harriman to a connection with the Natron cut-off at a point called in this record Odell Junction. The Oregon commission proposes an extension from Bend to connect at Odell Junction, and a branch to Lakeview to diverge from the Harriman-Odell line at some point east of Odell Junction. The lengths of the various extensions sought are as stated below. They are claimed to constitute uncompleted parts of former projects, which have already been described in a general way.

Name	Single track (miles)
Natron cut-off (revised mileage)	110. 0
Harriman-Odell section	171. 0
Harriman-Burns branch	25. 0
Lakeview branch	104. 0
Bend-Odell section	52. 1

The only railroad the Southern Pacific specifically is called upon to construct is the Natron cut-off; and as that project is nearing its completion no mandate seems necessary or appropriate.

The construction of this gap was authorized by division 4 on August 15, 1923, in construction of Natron cut-off by Central Pacific Ry., supra. All of the capital stock of the Central Pacific except directors' qualifying shares, is owned by the Southern Pacific, and its lines are operated under lease as part of the Southern Pacific system. Construction began on September 1 ,1923, and completion is expected virtually by July 1, 1926, as specified in the report. The total cost for 110 miles of track (revised mileage) will equal about

$16,000,000. The high cost is due to the ruggedness of the country traversed. It will provide an alternative main route with the
2797 present line over the Siskiyou Mountains between California and Oregon. The authority was conferred without limiting the scope of the relief that may be granted in the instant proceeding.

The Oregon commission's complaint calls upon the Union Pacific system, as already described, to bear the construction of all the other extensions sought, under such conditions as to usage by other carriers, such as the Oregon Trunk, as may be found desirable. It is suggested that the proposed cross-State line would furnish a favorable alternative route of the Oregon-Washington with its present route over the Blue Mountains. The latter responds that such an alternative route should terminate at Portland and not at Eugene, 123 miles south of Portland, or at Oakridge or Odell Junction. The routing arrangements between the proposed cross-State line and connecting lines in western Oregon have vital bearing on the volume of traffic available for the former.

History of the projects

The construction sought is substantially that projected, surveyed, and partially performed between 1905 and 1912, under the joint control of the Harriman régime. Under arrangements between existing and the projected lines by which the latter had unqualified assurance of a large volume of the traffic known to be available, the practicability of the proposed lines was unquestioned. Traffic between western Oregon and points east was then routed over the Oregon-Washington by Portland instead of by Roseville and Ogden. It was anticipated that the construction of various contemplated feeder lines would congest the Portland terminals, which could be avoided by routing eastbound and westbound traffic over a line across the center of the State in sufficient volume to sustain it. A north-and-south line through Bend and Klamath Falls was also deemed essential.

The plan was then initiated, in contemplation of freely routing over these lines the traffic originated by any of the present and subsequent Southern Pacific and Oregon-Washington branches west of the Cascades and north of the Siskiyou Mountains. A line of railroad from Malheur Junction to Vale, Ore., commenced as an independent enterprise, was acquired and completed, and opened for operation in 1906. Construction westward from Vale and eastward from Natron, Ore., was begun in 1911, and the Deschutes line was completed as far as Bend in the same year. But upon the separation of the Union Pacific and Southern Pacific systems in 1912, with the Central Pacific having the title and possession of the Natron cut-off, and with an enforced separation of the Central from the Southern Pacific a possibility, work on the cross-State line from the Ontario end was suspended at Juntura in 1913. In 1915 the Malheur Valley line was extended to Riverside, and in 1916 to Crane, in the Harney Valley,

in order to encourage the development of that district. Work on the Natron cut-off was suspended in 1913. Stock ownership of the Central Pacific having been in the Southern Pacific, the Oregon-Washington was virtually denied access to the industries in Klamath county and western Oregon. The granting of the use of the Natron cut-off, urged by the Oregon commission, would partially eliminate this difficulty but would not solve the feeder line question in western Oregon for the Union Pacific, if thus admitted into the heart of the Willamette Valley.

Suggested alternative routes

2798 Interveners from Prineville advocate, in lieu of the Harriman-Odell extension, a line northwesterly from Burns along or across the Malhour and Ochoco forest reserves and down the Crooked River to Prineville, approximately 125 miles. There it would connect with the 19-mile branch line of railroad operated by the city of Prineville from the Deschutes line.

The record contains other suggestions, in opposition to the route sought by the Oregon commission. One is for the location of the line in a northwesterly direction from Burns to Bend just above the semi-arid region, thereby being in a position to draw freight tonnage in route from the timber resources of the Blue Mountains and Ochoco forest reserve and become self-sustained much earlier than a line farther south. The Southern Pacific calls attention to the old route of the Corvallis & Eastern, projected as already described, through Sisters, over a pass 55 miles north of Odell Lake, and thence down the Santiam River. But none of these alternative routes appear to meet the demands of the situation as well as the line proposed by the Oregon commission. However, they are worthy of further consideration in connection with future railroad development of Oregon.

Position taken by defendants

The Union Pacific and its affiliated lines admit the circuity of present routes between various parts of Oregon, and the existence of vast undeveloped resources, but deny that under existing circumstances of railroad ownership and control in western Oregon traffic would be available to produce adequate revenue for the separate operation and maintenance of any of this track that they may be required to construct. This assumes the termination of the east-and-west line at Odell Junction and the receipt from the Southern Pacific at the last-named point of only such traffic as the latter would be willing to divert to the Oregon-Washington.

These defendants also challenge the sufficiency of the complaint, in that it does not with certainty apprise them of the construction expected of each of them. Complainant has left to us the designation of the defendant which should construct each extension. It suggests that the Union Pacific system construct extensions from Harriman to Odell Junction, from Bend to Odell Junction, and the branch

from the former to Lakeview, and that the trackage between Odell Junction and Eugene and between Odell Junction and Klamath Falls might be brought under joint or common use, in order that through traffic might move freely between eastern and western Oregon and California.

The Southern Pacific opposes the use of the Natron cut-off by other roads.

To the statement of these defendants that such a line should terminate at Portland and not at Eugene, the suggestion is made for the use of the Oregon Electric Railway between Eugene and Portland. The latter parallels the Southern Pacific in the Willamette Valley, and affords a direct route. It is in great need of additional traffic.

2799 It is further contended by defendants that, if the part of the act relied on by complainant is construed as conferring upon us authority to require of defendants the construction, operation and maintenance of the extensions sought, it is unconstitutional and void, in violation of the fifth amendment.

The Oregon Trunk extends from a junction with the Spokane, Portland & Seattle at Fallbridge, Wash., to Bend. It is 151.9 miles long. It parallels the Des Chutes branch of the Oregon-Washington part of the way and has joint or common trackage rights the remainder of the distance. Upon oral argument of the Oregon commission case, it indicated its intention to make application to us for authority to extend its line to the south, and its application to that effect is considered later in this report. Unaided, the Oregon Trunk could not make the extension sought, but would have to depend upon its parent lines. During its existence it consistently has failed to earn its expenses and interest on its obligations. It has no bonded debt, and its capital investment is covered by stock and notes.

Preliminary considerations

Recognizing the necessity for through traffic pending the development of local traffic upon the lines proposed, the Union Pacific objects because it would have little assurance, under the plan suggested by the Oregon commission, of securing such traffic. Therefore the Oregon commission urges that we take whatever steps are necessary to see that the proposed development meets the necessities of the State. That a cross-State line may be successful, it must have a volume of through traffic from the vast stands of fir timber on and west of the Cascades, from the products of the rich Willamette Valley, and from the forest and agricultural products of the Klamath Falls district. Klamath Falls is second to Portland, of Oregon points, in the volume of traffic it originates. Its lumber shipments alone during 1923 amounted to 339,500,000 feet board measure. Even with joint or common use by the Oregon-Washington of the Natron cut-off, it would reach in its own name only Oakridge and Kirk, 46 miles from Eugene and 41 miles from Klamath Falls, respectively. Construction of connecting links for these distances

would be relatively light if joint use of tracks of the Southern Pacific or its subsidiaries to Eugene and Klamath Falls could not be obtained, but this would involve a duplication of facilities which all would depreciate. At these points interchange would be made with the Southern Pacific lines or the Oregon Electric. As the road that supplies the empty cars usually controls outbound routing of the traffic, without further arrangements, either voluntarily made or enforced under some mandate of the interstate commerce act, a cross-State line of the Oregon-Washington would have assurance of only a limited quantity of through traffic.

The various classes of traffic that might be anticipated by the proposed lines, the receipt of a large share or all of which they should have assurance, may be segregated as follows:

(*a*) Local traffic, from point to point on the lines.

(*b*) Traffic originating on the proposed lines but destined to points on other lines.

(*c*) Traffic originating at outside points and destined to points on these lines.

(*d*) Through, or so-called "bridge," traffic, received from and delivered to connections.

2800 The most important districts from and to which traffic would move over the lines, aside from western Oregon, are Puget Sound, the inland empire (particularly eastern Washington and northern Idaho), southern Idaho, Utah, and northern and central California, as well as transcontinental territory. Through Bend and Klamath Falls the route would be shorter between California and the inland empire than by Portland. Across the State and by Klamath Falls the route would be shorter between southern Idaho and central California than by Ogden.[3] The cross-State route over the Natron cut-off between Portland and transcontinental territory would have markedly more favorable grades than the present line of the Union Pacific system over the Blue Mountains in northeastern Oregon.

Idaho finds important markets for its live-stock at Portland and on Puget Sound, but needs as well the California markets. Decreasing the distance to San Francisco, as would follow the construction of the Harriman-Odell extension, would broaden the markets of producers throughout southwestern Idaho. California, with increasing population, finds greater need for the products of the interior, and conversely, for additional markets for its own products in the northwestern States of Oregon, Idaho, and Montana.

Car supply

During many periods in the history of Oregon, its industrial activity and development has been retarded by continually recurring severe

[3] The completion of the cut-off between Rogerson, Idaho, and Wells, Nev., authorized in public-convenience certificate to Idaho Central R. R., 70 I. C. C. 265, makes qualification necessary of this statement, based on the present record. Distances from southwestern Idaho to central California are 189 miles less by that cut-off than the route via Ogden, and slightly less than the distances over the proposed Harriman-Odell extension. This cut-off may lessen the necessity of a line across Oregon, dependent upon the extent of its use.

car shortages. The commercial prosperity of the State is so dependent upon the marketing of its products that it quickly responds to any slackening in movement. The lack of effective rail competition, previously mentioned, accentuates this situation. Except for the Oregon Electric, the Southern Pacific is without railroad competition in all western Oregon south of Portland. The Oregon-Washington predominates in northern and northeastern Oregon. Complainant is extremely desirous that the Union Pacific lines shall enter the southern Willamette Valley, that the resulting competition and increase supply of empty cars may stimulate the development of that section as well as of eastern Oregon.

As the Southern Pacific originates the great part of the outgoing traffic of western Oregon, shippers there are dependent upon that road for their supply of empty cars. Thus the Southern Pacific largely controls the routing of the business. Empty cars move by California junctions and north over the 3.3 per cent grade in the Siskiyou Mountains, and outgoing transcontinental traffic moves in the reverse direction, a haul of from 325 to 600 miles greater each way than the distance directly across Oregon on the route proposed. During nearly every year for the past two decades the State has suffered a shortage of cars at critical times, so that its industries have been forced to curtail operations when the demand for their products has been the greatest. There were severe car shortages during 1903, 1904, 1905, and 1906. Conditions were more favorable thence until 1916, when they became worse largely in consequence of the movement of traffic to the Atlantic seaboard for European war purposes. Subsequent periods of car shortage have been from August, 1917, to October, 1918, from September, 1919, to December, 1920, from July, 1922, to January 1923, during which time a shopmen's strike
2801 occurred, and from April to November, 1923. The shortage in 1920 amounted to 2,400 cars. There were serious labor disturbances on the lines of the Southern Pacific and Union Pacific during the joint control which were not existent upon other lines in the Pacific northwest.

This condition generally is worse in the Willamette Valley than in adjacent States. The small lumber millers suffer more acutely than do the large producers. One of the main causes of the difficulty, as admitted by the assistant general manager of the Southern Pacific, sand as amply corroborated by witnesses for the shippers, is that (by that line) "Oregon is very remote from the center of consumption and is the hardest coutry in America to get empties into" and "the capacity of the track over the Siskiyou Mountains is not great and never will be because of the severe operating conditions." The Natron cut-off will mitigate, but cannot entirely avoid the recurrence of conditions of this character. The construction of the proposed cross-State line, it is said, would greatly relieve car shortages by the avoidance of the long haul by California points and by making available the supply of cars of the Union Pacific system. Such relief would be dependent upon the volume of traffic interchanged between

the carriers at Odell Junction or at Eugene and Klamath Falls. During the last quarter of 1922, of the Spokane, Portland & Seattle, the Oregon Short Line, the Oregon-Washington, the Great Northern and the Southern Pacific, the last named was the lowest in percentage of empty cars supplied to those ordered. Shippers of lumber and other commodities in the State of Washington seldom experience car shortages as severe as those met in the Willamette Valley. They enjoy greater carrier competition, and in most instances have available the empty cars of more than one system. The marketing of Oregon timber is languishing in comparison with that of Washington and California. The reason, as stated by an experienced witness, is that operators who contemplate the erection of mills find no carrier competition in Oregon and go to Washington, where there are more railroads and an ample supply of equipment in which to move the output. Thus they are in a better position to profit when lumber commands a premium in middle western and eastern markets. Nevertheless, the traffic carried by the Southern Pacific on its Oregon lines has shown marked increase.

Potential and probable traffic

Painstaking estimates as to the amount of traffic potentially and probably available have been made and submitted by the parties. In important instances they are in conflict which can only be reconciled by remembering that they are at best but estimates, with many problematical factors and variables upon which judgments may well differ. It is not necessary for us to attempt to weigh and reconcile, or if unreconcilable, determine each item in the estimates. But it will be desirable, both to aid in consideration of the Oregon Commission's complaint and in the finance docket applications later
2802 discussed, to examine and state in a very general way the nature of the traffic which may be available in the affected territory. In response to a resolution of the Senate, on February 4, 1924, we made a report, Transportation Facilities in Northwest Pacific States, 87 I. C. C. 472, which gave in some detail the results of a survey of the traffic of the Northwest Pacific-slope States.

In the hearing upon the Oregon commission's complaint, the affected territory is taken as that part of the State, except the southeastern corner, which is south of an irregular line crossing the Willamette Valley approximately 30 miles south of Portland, and eastern Oregon through Canyon City.

It is asserted that the effects of traffic movement to and from this territory over the Natron cut-off would be a concentration of population around Eugene as a center, an increase in land values, and a transformation of agricultural industry from hay and grain growing to the production of higher-valued crops and to dairying. The counties traversed are Malheur, Harney, Lake, Klamath, Crook, and Deschutes. Their population, as shown by the census reports, and that of the State of Oregon, was as follows:

County	1900	1910	1920	Per square mile, 1920
Malheur	4,302	8,601	10,907	1.1
Harney	2,593	4,095	3,992	0.4
Lake	2,847	4,658	3,491	0.5
Klamath	3,970	8,554	11,413	1.9
Crook	Boundaries changed		3,424	1.2
Deschutes	Organized 1916		9,622	3.1
Entire State	413,536	672,765	783,389	8.2

The difference in general climatic conditions and in altitude makes the sections of Oregon east and west of the Cascade Mountains entirely unlike in character, especially as the country recedes from the mountain range. These conditions have profoundly influenced the population and economy of eastern Oregon. As we might expect in a semiarid country at high elevation, we find livestock raising a predominating industry, with agriculture limited by the supply of water, and therefore ranging from the sparse and hardy grains of the dry-land farmer to the profuse and diversified products of the irrigationist in the favored valley. These conditions prevail throughout much of the territory here considered. There can be no large cities in such territory under usual circumstances, especially in the absence of adequate transportation. Bend, with a population of 8,000, which has chiefly come to it with the lumber industry, is the largest municipality in the territory under consideration. Access to large markets where the livestock, or the bulky low grade or specialty agricultural products, can be transported at favorable transportation costs, is the life of the community.

The counties are large and the distances great. There is much rough land, which, however, finds its use in large part as pasturage and grazing ground for livestock. To counterbalance this wastage, the valleys are often of considerable extent and of extraordinary fertility. There is more water available for irrigation than has yet been utilized, although the area of irrigated land has increased
2803 progressively. It is, of course, not feasible to develop a source of irrigation water and to apply it to the reclamation of land at heavy expense, unless markets for the crops raised can be assured within practicable reach of the producer.

In eastern Oregon, with adjacent protions of the States of California, Nevada, and Idaho, we therefore find important sources of supply of livestock, more especially of cattle, sheep, and horses. Wool from this section is an important source of the Nation's supply, and finds its market on both coasts. The dairy industry has shown growth, limited in part by the availability of the markets in California and upon the north Pacific coast. Evidently the sugar-beet industry is capable of development. Potatoes and other vegetables from the large and highly developed irrigated sections of Idaho find ready market. Hay is produced in profusion; but its production must be limited by the use to be made of it locally, in the absence of railroad transportation to other capable consuming markets. Wheat and the coarse grains are produced in quantities varying with the soil and cli-

matic conditions. Livestock goes long distances to the market on its own feet, but this is relatively expensive, and involves shrinkage in quantity and quality which is reflected in the price received. Herds of feeder cattle might be brought in by suitable rail transportation, which would consume locally grown products and encourage development. At the risk of repetition, we may say it is clear that the principal markets for the present and prospective products of agriculture, including livestock, of the portions of the States mentioned, must be found in the much more densely settled western slope of the States of Oregon, Washington, and northern California and markets reached through the ports and gateways of the western slope.

The mineral resources are very limited. Extensive deposits of sodium carbonate are contained in Alkali Lake, 18 miles south of the proposed cross-State line, in the eastern part of Lake County. Much is said as to the inexhaustibility of the supply of this product and its unequalled purity. The product is evidently of great value when markets can be reached with good transportation. Substantial financial interests stand ready to develop the project when transportation is assured. Silicate of soda is named as another product which could be produced in south-central Oregon in quantity.

The traffic which most certainly would be afforded in large volume immediately and for a long period in the future, is the products of forests. The timber resources of the general section involved are great. In the near-by States of Washington and California, the rate of cutting has been greater, and with the diminution of the available supply from the Southern States, the supply of standing timber in Oregon must be looked to by the whole country as of increasing and prime importance.

The State contains 21.6 per cent of the standing timber of the United States, 80 per cent of which is west of the Cascade Mountains. Of the total in the State, 70 per cent, or 350,000,000,000 feet, is tributary to the Southern Pacific lines—320,000,000,000 feet west of the Cascades and 30,000,000,000 feet in the Klamath Basin; a large proportion of this timber, enormous in its aggregate, is the property of the Nation. It is administered under conditions designed to secure the continuance of the supply steadily for generations. The threat-

2804 ened diminution in the available supply of southern pine has resulted in increasing reliance being placed by the country upon the timber of the Pacific coast. It is estimated that within 10 years 11,000,000,000 feet more per annum than is now produced will have to come from the Pacific coast. With 43 per cent of the stand, Oregon's share of the increase will be close to 5,000,000,000 feet. Thus the present output of 3,500,000,000 feet per year, or 140,000 carloads, may reasonably be increased to 8,500,000,000 feet, or 340,000 carloads.[4]

Of the 50,000,000,000 feet assigned to the territory east of the Cascades, the principal tracts are in the Klamath Basin and in terri-

[4] This volume of traffic is stated to be in excess of the carrying capacity of the existing lines over the Siskiyou mountains, which would be called upon to handle most of it, inasmuch as the Southern Pacific now is the only road in the southwestern part of the State. As that road would be expected to supply the empty cars, only a small part of this traffic would move by Portland over the Columbia River routes.

tories tributary to Lakeview and Bend. The testimony as to the amounts in these several territories is conflicting, but according to the record as a whole the amount that may be considered tributary to Klamath Falls is approximately 24,000,000,000 feet, tributary to Lakeview about 3,000,000,000 feet, and tributary to the Deschutes River lines about 14,000,000,000 feet. There are other forests in eastern Oregon which have resources considerable in themselves, but relatively small as compared with the tracts in the western half of the State to which reference has been made. These figures do not include about 5,500,000,000 feet south of Oregon, tributary to the proposed lines. The entire eastern slope of the Cascade Mountains reaching to Lakeview on the south, is heavily timbered, and large stands would be tributary to the eastern end of the cross-State line.

But the large stands on the north are more accessible from the proposed extension southward from Bend to the Natron cut-off. Any additional traffic to or from territory on the south or over the Cascades on the west would have to be interchanged with the road operating the Natron cut-off, in the absence of arrangements for through movement. Both this section of the proposed cross-State line and the Natron cut-off, while partly in mountainous territory, are capable of originating considerable traffic in forest products. The proposed line from Bend southward to the Natron cut-off would be almost wholly through forested territory, perhaps the finest body of standing pine timber in the world. Two large mills now in operation at Bend draw their supply of logs from large adjacent timber areas controlled by them.

The best expert opinion points to a heavy increase in the volume of shipments of lumber from the north Pacific coast to meet which an adequate transportation machine is imperative. The public interest in this comprises the individual producers, and their consuming customers in other sections; the State, which finds in lumber its principal industry; and the Federal Government, as the proprietor of national forests which contain more than 130,000,000,000 feet of standing timber.[5]

The national forest reserves in western Oregon contain timber estimated at 91,600,000,000 feet, and those in eastern Oregon 47,000,000,000 feet. Roughly, 80 per cent of that in western Oregon and 50 per cent of that in eastern Oregon would be accessible by logging roads from the proposed extensions and existing lines in southwestern Oregon.

2805 The privately owned forest lands in western Oregon contain approximately 110,000,000,000 feet of standing timber, mainly fir. Those in eastern Oregon, contain approximately 29,510,000,000 feet, mainly pine. A large proportion, estimated at 24 per cent, for the State is mature and will deteriorate rapidly. Much destruction is caused by forest fires.

As summarized by complainant, in the entire south-central and southeastern sections of Oregon, there are 533,000 acres of land now

[5] A statement by the Chief of the United States Forestry Service, of record, is pertinent.

under irrigation, 613,000 acres are proposed for irrigation, and 327,340 acres of swamp land can be reclaimed. Heretofore, stock-raising has been the chief industry of this part of the State, but upon the construction of adequate transportation the stimulus to more extensive development of diversified farming is expected to produce a variety of outgoing tonnage.

Defendants' list of productive agricultural areas in Harney and Lake Counties directly tributary to the projects differs from that of complainant as to the lands included. The following is defendants' summary of lands capable of being developed under controlled irrigation, apart from that served by overflow from streams, on the assumption that sufficient water is available:

Districts	Acres		Acres cultivated	
	Irrigable	Irrigated	Irrigated	Dry farmed
Harney Valley	77,000	42,000	6,000	(?)
Silver Creek	16,000	4,000	800	(?)
Blitzen	34,000	20,000	1,100	(?)
Fort Rock	33,180			25,000
Silver Lake	16,800	1,500	1,500	(?)
Summer Lake	7,179	1,860	860	2,601
Chewaucan Valley	38,364	24,300	1,500	4,000
Goose Lake Valley	62,500	37,500	15,000	(?)
Walker Basin	8,400	120	120	(?)
	293,423	131,280	26,880	(?)

This acreage has been separated as to railroad extensions as stated below:

Line	Acres		Acres cultivated	
	Irrigable	Irrigated	Irrigated	Dry farmed
Harriman-Burns	77,000	42,000	6,000	(?)
Harriman-Odell	107,159	27,360	4,260	(?)
Lakeview	100,864	61,800	16,500	(?)
Bend-Odell	8,400	120	120	(?)

Our present yearly cut from these Government properties is 137,000,000 feet of timber. The yearly cut from the national forests of Oregon could properly be increased to ten or twelve times the present amount, while still insuring the unimpaired perpetuation of the resource and utilizing only its current annual growth. It would be desirable from every standpoint to bring the cut from the national forests up to that amount, to utilize old virgin timber that is now deteriorating from decay to increase public revenue for the Nation and State, and to afford an additional supply of forest products for the markets of the country. The possibility of increasing the cut from the national forests depends to a considerable degree upon the enlargement of rail facilities. To this extent the Government has a direct interest in the matter. The predominant consideration, however, in my judgment, should be the fact that the dependence of the entire country for softwood timber is rapidly shifting to the west coast, and that its existing rail facilities are inadequate to meet this growing demand.

2806 In Malheur, Harney, Lake Klamath, Crook, and Deschutes Counties, approximately $5,550,000 has been expended upon highways to make the productive localities accessible. To complete the State highways already laid out, the expenditure of $5,700,000 will be necessary. The total, between $11,000,000 and $12,000,000, does not include expenditures by the counties for so-called county

roads. The highway development is recent and not yet comprehensive in extent of ramifications. While certain of these important trunk lines, such as the highway paralleling the proposed Deschutes Valley extension to Klamath Falls, will aid in the development of interior Oregon, they can not take the place of railways in affording the long distance transportation which the products of central Oregon require if the country is to grow and prosper.

The eastern slope of the Cascades from Klamath Falls to Bend possesses possibilities of development from a recreational standpoint, with its many beautiful lakes, rugged mountains and other scenic attractions, and a very favorable climate.

The agricultural and horticultural possibilities of the Willamette Valley and western Oregon generally are well understood. According to data assembled and published by the Southern Pacific in 1923, only one-third of western Oregon is in cultivation. The dairying industry has reached a high state of development. A large amount of leguminous feed from central and eastern Oregon is needed. The tendency is toward the production of the high valued crops, which will force the use of the central and eastern Oregon crops of hay and grain, if available. The vegetables and ripe fruits of the central portion of western Oregon are handicapped in the eastern markets by the superior transportation given their California competitors, amounting to two days in transit. Both the soil and climate of western Oregon are favorable to the intensive production of high-class commodities, such as fruits, nuts, vegetables, berries, vine crops, poultry, eggs, and dairy products. Over 75 per cent of the orchard and dairy output of western Oregon is shipped to points east of the Rocky Mountains, largely in competition with California products. Direct and expeditious service is essential to the development of this section equally with competitive producing districts in California and Washington.

In the southwestern counties of Oregon are 180,000,000,000 feet of standing timber, chiefly fir, 56,000,000,000 feet of which are under Federal ownership. A large part of this, upon the construction of tap lines, could move as regular traffic over a direct route across central Oregon to middle western and eastern markets, if given equal car supply and rates with other routes. The National Government has authorized the sale of large stands in remote districts, sometimes with the provision that a substantial part of the sale price shall be devoted to the construction of common carrier railroads for general development of the district.

At the hearing upon the Oregon commission's complaint, the traffic possibilities to and from southern Idaho were discussed at length. That State possesses highly developed large irrigation possibilities, and because of its inland situation and distance from great consuming centers, is keenly interested in adequate and eco-
2807 nomical transportation. California presents one of its important markets, especially for surplus products. A reduction in the rail distance to California markets would doubtless stimulate the movement of these agricultural products and would be of material

aid to the agricultural and livestock industries of that State. The construction of the Rogerson-Wells cut-off will bring the Idaho Falls and Twin Falls districts closer to San Francisco by that route than they would be over the proposed cross-State line; from other districts the disparity between the distances by Wells and by the cross-State line proposed are not great, relatively to the entire hauls involved.

The Oregon commission directs attention to the adequacy of the ports of Portland and Coos Bay, which have been developed at great expense, and which afford marked possibilities for expansion of the already important coastal, intercoastal, and foreign commerce passing through them. A cross-State line would be of much service, under favorable traffic arrangements, in the development of these functions of the ports named, and particularly of Coos Bay.

Complainant's traffic estimates

The volume of the principal traffic expected by complainant to originate in Oregon and move over the desired lines is shown below:

Commodity	Annually, first 5 years	Annually, after 5 years	Movement
Dairy feeds	100,000 tons	140,000 tons	From eastern Oregon to Willamette Valley.
Hay	450,000 tons	630,000 tons	From eastern Oregon to Willamette Valley.
Livestock	120,000 sheep	150,000 sheep	From eastern Oregon to coast markets.
	45,000 hogs	56,250 hogs	
	20,000 cattle	25,000 cattle	
Wool	750 tons	1,000 tons	From eastern and central Oregon.
Prunes	7,312 tons	14,264 tons	Eastward.
Cherries	22 carloads	88 carloads	Eastward.
Canned goods	633 carloads	791 carloads	Eastward.
Walnuts	92 tons	118 tons	Eastward.
Lumber:			
Fir	690,000,000 ft	862,000,000 ft	Eastward.
Pine	396,500,000 ft	495,000,000 ft	Eastward.
Dairy products	(1)	(1)	Eastward.
L. c. l. freight	(1)	(1)	Both directions.

[1] Not estimated.

Chemical products from eastern Oregon, fuel oil or supplies, shipments of broccoli and perhaps other perishable vegetables, and manufactured products, are not included in the estimate.

The foregoing statistics constitute an average of approximately 93,000 carloads of traffic annually during the first 5 years. They contemplate and are predicated upon a freedom of opportunity of development of business in western Oregon by the Oregon-
2808 Washington and a substantial share of that which may originate on existing Southern Pacific lines. Conservatism is claimed for this estimate. Individual witnesses make estimates of the probable average annual tonnage available for these projects which aggregate 2,946,203 tons, or 47.3 per cent more than complainant's estimates.

No estimate is made of the probable through traffic from California to Idaho by Odell Junction, or between California and the Inland Empire by Klamath Falls and Bend.

Certain other traffic, as that for export, has not been included in the estimates. While these omissions make for conservatism in the estimates submitted, the present and future validity of the estimates is seriously discounted by (1) the approaching completion of the Natron cut-off, (2) the completion of the Rogerson-Wells cut-off, and (3) the growth of transcontinental business through the Panama Canal, and may be further impaired should we authorize the relief sought in any or all of the finance dockets presently to be considered. As the Oregon commission complaint case was heard and submitted before any of the finance docket applications were made, this implies no criticism of the testimony, but the fact makes it unnecessary and undesirable to analyze the estimate submitted with greater completeness.

Defendants' estimates. Defendant Oregon-Washington bases its opinion that the agricultural development on which complainant's traffic estimates are predicted would not progress as rapidly as anticipated by complainant, upon the history of the development of other promising irrigation enterprises. The complainant's estimates have been subjected to a searching analysis in the record made by defendants. What has been said as to the validity of the complainant's estimates applies with like force to those submitted by the defendants.

The Oregon-Washington states that its present traffic from and to Portland and western Oregon is less than at the time of the Union Pacific-Southern Pacific dissolution. This is due partly to the change of relationship between this road and the originating lines south of Portland. The Southern Pacific, as the originator of traffic in western Oregon, retains the long haul whenever practicable. Other causes are canal competition, and perhaps inadequate extensions into promising territory. Nevertheless the traffic density of the Oregon-Washington in 1922 was the greatest of any transcontinental line in the Pacific northwest, despite its difficult grades over the Blue Mountains.

The Oregon-Washington contends that much of the 30,000,000,000 feet of merchantable timber on the eastern slopes of the Cascades between Bend and the California-Oregon State line is now accessible by logging roads from Klamath Falls, Bend, or points on the Natron cut-off without additional lines. It concedes that a north-and-south line between Bend and Lakeview, properly located to serve the timber and agricultural areas, is more deserving of consideration than a cross-state extension, under present conditions of ownership of lines in western Oregon. As the traffic on the Deschutes branch now preponderates in the northerly direction, substantial movements in the opposite direction to Lakeview and through Klamath Falls would partly balance the empty-car movement.

The proposed cross-State line is opposed by the Oregon-Washington as a waste of capital, on the grounds that it would not be self-supporting under existing circumstances of railroad ownership in western
2809 Oregon and because of difficulties of operation crossing the 75-mile semiarid region. The present population within 20 miles on each side of all the proposed extensions, excluding Bend, is approximately 7,500 persons. There is no town with over 200 persons within 10 miles of these lines, excepting Bend and Lakeview.

The Southern Pacific is said to be so strongly entrenched in western Oregon, with its main lines and branches reaching the districts where traffic originates or is delivered, that a cross-State line under different ownership would expect little traffic from that section. Articles such as canned goods, fruits, etc., which originate at points in the Willamette Valley nearer Portland than Eugene, such as Salem, can more advantageously move eastward over the present main line of the Oregon-Washington rather than by Odell Junction and a cross-State line. Oregon-Washington's main line, it is claimed, has a capacity for much heavier traffic than it now receives.

It is claimed that, when need arises for improved transportation between the Nampa district and San Francisco, the construction of an additional 44-mile cut-off from Glenn's Ferry, Idaho, to Buhl, Idaho, will furnish a route in connection with the Rogerson-Wells cut-off substantially equidistant with a route across Oregon via Odell Junction, over highly improved railroads, with advantageous grades and better service.

In short, the Oregon-Washington takes the position that the only way a cross-State line could sustain itself would be to restore the relationship of railroads to the several districts that existed prior to the dissolution of the Union Pacific and Southern Pacific systems, whereby the traffic from or to western Oregon north of the Siskiyou Mountains would become available for routing across the State. Eugene, as a key point in the greater development of western Oregon, is the radiating point of numerous main and branch line railways. But, with the exception of the Oregon Electric, all are now included in the Southern Pacific system, with outlets to the south only.

The traffic estimates of the Oregon-Washington, under the limitations before discussed, are as follows:

Line	First	Second	Tons per year		
			Third	Fourth	Fifth
Harriman-Odell, outbound	41, 769	44, 308	45, 030	45, 849	46, 625
Do inbound	3, 916	4, 320	5, 144	5, 845	6, 890
Total	45, 685	48, 628	50, 174	51, 694	53, 515
Lakeview, outbound	50, 924	49, 834	51, 198	52, 181	53, 168
Do inbound	4, 580	4, 902	5, 556	6, 067	6, 730
Total	55, 504	54, 736	56, 754	58, 248	59, 898
Bend-Odell, outbound	17, 239	17, 249	18, 912	20, 711	22, 756
Do inbound	580	623	775	760	812
Total	17, 819	17, 872	19, 687	21, 471	23, 568

No tonnage from Alkali Lake has been included in the above data.

2810 Probable railway operating revenues

The considerations which have been shown to make the estimates as to the probable traffic unreliable as guides in the present inquiry likewise impair the estimates submitted as to the probable operating revenues of the lines sought by the Oregon commission. The Oregon commission's estimate of the average annual revenue contemplated during the first five years, with certain traffic omitted as previously stated, is as follows:

Traffic		Probable revenue
Outbound, originating on lines	2,000,354 tons	$2,549,204
Inbound, destined to lines	132,900 "	320,355
Through:		
Idaho to California	71,458 "	256,245
Other	57,758 "	397,895
	2,262,470 "	3,523,699
Passenger traffic revenue:		
15% of freight revenue		52,855
Total		3,586,554
Per mile of road, 331.7 miles		10,813

These estimates, based on tonnage statistics assailed by defendants, are similarly characterized as excessive. They are said to make insufficient allowance for different ownership of lines and for the lawful rights of originating carriers. Movement of certain named commodities is claimed to be unlikely.

The Oregon-Washington has similarly applied current rates in this territory to its estimates of probable traffic, and arrives at the following range of operating revenues for the first five years.

Extension	Operating revenues	
	First year	Fifth year
Harriman-Odell	$328,988	$456,878
Lakeview	110,143	136,813
Bend-Odell	70,080	114,233
	509,211	707,924
Per mile of road, 331.7 miles	1,535	2,134

For comparison, the average operating revenue per mile of road, main and branch, of each of the following lines during 1923, is stated below.

Oregon-Washington	$13,492
Oregon Short Line	16,386
Union Pacific	31,676
Southern Pacific, Pacific system	27,890
Southern Pacific lines in Oregon	16,263
Great Northern	14,547
Spokane, Portland & Seattle	15,695

2811 Cost of construction

Approximately 80 per cent of the length of the Harriman-Odell extension would be light construction, and the remainder fairly heavy. The Lakeview branch would be somewhat more expensive than the other extensions. The Bend-Odell extension would be light construction. A logging road of standard construction, serving the mills at Bend, already extends about 27 miles of this distance.

Complainants' estimates of the probable cost of these projects are presented below.

Extension	Length (miles)	Estimated cost	Cost per mile
Harriman-Odell	171.0	$8,318,842	$48,643
Lakeview	104.0	5,369,077	51,625
Bend-Odell jct	52.1	2,129,643	40,876
	327.1	15,817,562	48,357
Tools and roadway machinery		32,662	86
		15,850,224	48,443

The last-named item, apparently omitted, has been added at the suggestion of the defendants.

A subsequent revision of the plans of the Natron cut-off reduces its length to 110 miles and locates the so-called Odell junction 18 miles west of its former proposed site, near Crescent Lake. This will have the effect of increasing the proposed Harriman-Odell section this distance, and the proposed Bend-Odell section, 12 miles. For convenience, the designation "Odell junction" or "Odell" will be continued throughout this report, regardless of the precise location or future name of this junction point.

The estimates on which the defendants rely are stated below.

Extension	Distance (miles)	Estimated cost	Cost per mile
Harriman-Odell	188.9	$10,436,916	$55,251
Lakeview	78.7	4,868,518	61,862
Bend-Odell	64.1	3,151,150	49,160
	331.7	18,456,584	55,642

The estimates of both parties are exclusive of working capital, such as cash and current supplies. Rolling stock of a probable cost of $2,518,800, included in defendants' estimate, has been taken out for comparison.

The mean of the two estimates, slightly under $17,250,000 or $52,000 per mile, may be taken as a sufficiently reliable forecast of the probable cost for present purposes. Confirmation of the $52,000 estimate as an average is had by the fact that this was the cost per mile of building the first 30 miles of the Natron cut-off northward from Kirk over substantially similar terrain. Some sections of the cut-off will not exceed $49,000 per mile.

2812

Probable operating expenses

Complainant and defendants have submitted carefully prepared estimates of the operating expenses over the lines proposed by the Oregon commission. Necessarily these estimates are problematical. For reasons stated in the previous discussion of the probable volume of traffic, it is not desirable to follow the parties into a minute analysis of their claims, or to attempt to reconcile their differences.

Complainant estimates the average annual operating expenses of these extensions for the first 5 years as shown below.

Item	Amount
Maintenance of way and structures	$258, 400
Maintenance of equipment	830, 000
Traffic expenses	57, 300
Transportation	1, 366, 700
Miscellaneous operations	
General expenses	138, 700
Total	2, 662, 000
Per mile of road	5, 025

Taxes should run about $900 a mile, annually.

Defendants' estimate of probable annual operating expenses of these extensions, based on their anticipated volume of traffic, is as follows:

Extension	Operating expenses	Railway tax accruals	Equipment rents, dr.	Total
Harriman-Odell	$851, 308	$69, 215	$101, 353	$1, 021, 876
Lakeview	356, 065	28, 130	42, 526	426, 721
Bend-Odell	278, 434	36, 599	32, 564	347, 597
	1, 485, 807	133, 944	176, 443	1, 796, 194

These estimates are based largely on past operations of the Des Chutes branch.

Operating results

If the conditions as outlined by complainant were realized, the traffic over these extensions would produce annual revenue of $11,000 per mile of road at an expense for operation, taxes, and uncollectible revenue of $9,335 per mile of road. This would result in a yield of $1,665 annually on an investment of $52,000 per mile, equal to 3.2 per cent.

Defendants' estimates, under the limitations of ownership before discussed, would result in operating deficit ranging between the figures set out below.

Extension	Operating deficits	
	First year	Fifth year
Harriman-Odell	$602, 887	$564, 997
Lakeview	316, 577	290, 207
Bend-Odell	277, 517	233, 363
	1, 286, 981	1, 088, 567

On this basis, at the end of 5 years the operating deficit would equal $5,975,122, or, including a 6 per cent return on the investment, the sum of $12,267,771.

2813 Defendants Oregon-Washington and Oregon Short Line assert that without the endorsement of the dominant line, the Union Pacific, they would experience difficulty in financing the construction of these projects, as their operations during the past few years have been unsatisfactory. Allowing for bond interest, the Oregon-Washington operated at a loss of between one and five million dollars annually during 1921, 1922, and 1923. The Oregon Short Line states that the return on its investment during the same years did not exceed between 4 and 5 per cent. It is questionable whether the three years afford a suitable basis for estimation of the future, because of abnormal economic conditions which prevailed during a considerable part of the period. The Public Utilities Commission of Idaho shows that for the period from July 1, 1896, to December 31, 1922, inclusive, the net earnings of this road totaled $190,541,890. A return of 5¾ per cent on the investment shown on its books is computed at $125,528,601, leaving earnings amounting to $65,013,289.

A comparison of operating ratios of the roads named below for 1922 may be of interest.

Name of the road:	Per cent
Oregon-Washington Railroad & Navigation Co	93. 82
Oregon Short Line	72. 43
Southern Pacific, Pacific system	70. 65
Union Pacific	68. 55
Spokane, Portland & Seattle	63. 79

There is no question raised as to the financial strength, or successful operating results of the Union Pacific, either the parent line or as a system.

Finance docket applications

Finance Docket No. 4730. Application of Oregon, California & Eastern Ry. Co.

The above-numbered application was the first of the series to be filed with us. As has been stated, this company now has in operation about 40 miles of line, extending eastward and northeastward from Klamath Falls, terminating at Sprague River. It seeks authority for the construction of a line extending from Sprague River in a northeasterly direction about 66 miles to Silver Lake; a line branching from the Silver Lake line at a point about 20 miles from Sprague River and extending in a northwesterly direction about 15 miles along the Williamson River, and a third line extending from Sprague River in a southeasterly direction about 79 miles to Lakeview. These distances, based upon engineering investigation, vary somewhat from those given in the applications. The purpose of all of these proposed lines, like that of the line already in operation, is principally to reach tracts of timber. The Silver Lake line extends through a timber tract and terminates in an open country, utilizable for pasturage. It is estimated that the total cost of the proposed lines, exclusive of equip-

ment, will be $4,581,140. The tracks are to be laid with 75-pound rail, and it is expected that the lines will be completed within three years. From the application, which gives estimates of the traffic and revenues expected from operation of the proposed lines, together with that of the existing line, it appears that, while the lines might not yield a fair return upon the investment as separately operated properties, they would nevertheless be profitable as feeders for a larger
2814–2815 system affording a long haul for the traffic originated.

It is asserted by some witnesses that the logs produced on the line of the Oregon, California & Eastern will be hauled to Klamath Falls for milling. Other witnesses assert that mills will be constructed at other points, thus avoiding the uneconomical haul of logs. It is estimated that the available timber traffic will afford tonnage for a period of at least twenty to twenty-five years, but its duration will depend to some extent upon the practices as to selection and conservation. About one-half of the timber in the Klamath Basin is on Indian reservations or in Government forest reserves.

Finance Docket No. 4810. Application of Oregon Trunk Railway

The second application of the series was filed by the Oregon Trunk Railway, a subsidiary of the Great Northern and Northern Pacific. It requests authority to construct and operate a line from Bend southwesterly about 65 miles to Paunina, on the Natron cut-off about midway between Kirk and Oakridge, and thence to Klamath Falls. The applicant sought an arrangement with the Southern Pacific whereby it might operate jointly with that company the section of the Natron cut-off between Paunina and Klamath Falls. The Southern Pacific declined to enter into the proposed arrangement, and the Oregon Trunk changed its plan, and proposes the construction of an additional line between Paunina and Klamath Falls, running at some distance to the eastward of the Natron cut-off, passing through Bonanza, and practically parallelling the existing line of the Oregon, California & Eastern and its proposed extension along the Williamson River. The total length of the line thus proposed from Bend to Klamath Falls is about 178 miles. The applicant estimated its cost to be about $6,500,000, but other applicants deemed this estimate too low. The new construction proposed is through territory offering no serious physical difficulties. Construction is to be finished by the end of the second summer after the start, and is to be financed by the proprietary companies without the issuance of securities other than notes.

The motive of the applicant stated is to secure access to the lumber traffic, present and future, of the Klamath Basin, and thus to anticipate and defer exhaustion of the timber tributary to its present line, to secure additional tonnage for its proprietary lines, and to supply consuming markets located thereon. The present line of the Oregon Trunk, from Fallbridge to Bend, represents an investment of about $15,000,000. It would not have been justified by traffic available in its present territory, even without competition. It was built with

high and expensive standards of construction, which greatly increased its cost. Obviously, it was but a fraction of a larger and more comprehensive project then in contemplation, the completion of which has been deferred. The canyon of the Deschutes River affords the only feasible access of a line from the Columbia River into central Oregon. The building war between the Deschutes Railroad, the subsidiary of the Union Pacific system, and the Oregon Trunk, added to the cost of both carriers, and forced them to parallel construction, until an armistice and treaty of peace brought about joint operation of the southerly portion of the line. Either the Oregon Trunk or the Deschutes branch of the Oregon-Washington could handle all the presently available traffic. If either line is to be made to pay, added traffic must be had.

2816 As a further reason for construction of this line, it is shown that the Weyerhacuser Timber Company and the Shevlin-Hixon Timber Company, now operating at or near Bend, have large timber holdings in the Klamath Basin, and desire to establish mills there; the mill of the Weyerhaeuser Timber Company to be located about 5 miles south of Klamath Falls. The timber produced by these companies has heretofore been shipped from Bend principally to territory reached by the northern transcontinental lines, and it is their desire to continue to serve that territory, hence, their need of the proposed line of the Oregon Trunk, which would afford a route about 94 miles shorter than could be afforded by the use of the Southern Pacific from Klamath Falls to Portland. The advantages of competition are stressed by these lumber companies: In fact, it seems to be the policy of one of them to locate no important mills at points served by only one carrier. The advantages of a diversified car supply, recognized in the coal industry, are equally important to lumber producers. There are the possibilities of failures of operation or of management, calamities, labor disturbances, and surplus production or consumers' demands, upon one railroad, which might well be overcome if the service of another carrier were available. Especially would this be a probability where the two carriers approach from different directions and meet at the common point. Competition as a stimulus for efficient operation has been recognized by us. As was the case in Construction of Line by Wenatchee Southern Ry. Co., 90 I. C. C. 237, 256, important and growing industries on the line proposed are shown to require efficient transportation. Notwithstanding all that may be said favorable to the dominant carrier in this section, and its present service, it has failed at times to meet demands made upon it. Advantages to the shippers of an additional outlet for their product are apparent. It is desirable that transportation facilities of high order be available to shippers from the Klamath Basin and central Oregon. The assurance of access to lines other than the Southern Pacific at critical periods is a factor of prime importance to such shippers and is clearly in the public interest. It is probable the competition afforded would stimulate the Southern Pacific to further improve its service. Competition, within reason,

rather than monopoly, is in the public interest. The foregoing will be recognized as a close paraphrase of portions of the report in the cited case.

Some question is raised in the record as to whether the rates from Bend will be carried by the Southern Pacific (which does not serve Bend) to Klamath Falls, and if so, whether the Oregon Trunk would be compelled to meet such rates. The general basis of rates into the territory, we must presume, will be such as the law requires or permits; and this question is of minor importance.

As compared with the total amount of money involved in the projects covered by these six finance applications, the amount of duplication of investment due to the proposed parallelling of the lines of the Oregon, California & Eastern from the Williamson River to the Sprague River, and thence to Klamath Falls is not considerable. As compared with the investment proposed by the Oregon Trunk, it is considerable; and as compared with that to be made by the Oregon, California & Eastern, it is substantial. The duplication of expense of construction which could be avoided by the joint use of the line of the Natron cut-off from Paunina into Klamath Falls, is substantial, and runs into the millions of dollars. Besides duplication of mileage, the Oregon Trunk would have to construct 34 miles more track than the length of the Natron cut off would involve. It is understood that the Oregon Trunk proposes its own terminals in Klamath Falls.

2817 As a further reason for construction of this line, it is shown that the Weyerhaeuser Timber Company and the Shevlin-Hixon Timber Company, now operating at or near Bend, have large timber holdings in the Klamath Basin, and desire to establish mills there; the mill of the Weyerhaeuser Timber Company to be located about 5 miles south of Klamath Falls. The timber produced by these companies has heretofore been shipped from Bend principally to territory reached by the northern transcontinental lines, and it is their desire to continue to serve that territory, hence, their need of the proposed line of the Oregon Trunk, which would afford a route about 94 miles shorter than could be afforded by the use of the Southern Pacific from Klamath Falls to Portland. The advantages of competition are stressed by these lumber companies: In fact, it seems to be the policy of one of them to locate no important mills at points served by only one carrier. The advantages of a diversified car supply, recognized in the coal industry, are equally important to lumber producers. There are the possibilities of failures of operation or of management, calamities, labor disturbances, and surplus production or consumers' demands, upon one railroad, which might well be overcome if the service of another carrier were available. Especially would this be a probability where the two carriers approach from different directions and meet at the common point. Competition as a stimulus for efficient operation has been recognized by us. As was the case in Construction of Line by Wenatchee Southern Ry. Co., 90 I. C. C. 237, 256, important and growing industries on the line proposed are shown to require efficient transportation. Notwith-

standing all that may be said favorable to the dominant carrier in this section, and its present service, it has failed at times to meet demands made upon it. Advantages to the shippers of an additional outlet for their product are apparent. It is desirable that transportation facilities of high order be available to shippers from the Klamath Basin and central Oregon. The assurance of access to lines other than the Southern Pacific at critical periods is a factor of prime importance to such shippers and is clearly in the public interest. It is probable the competition afforded would stimulate the Southern Pacific to further improve its service. Competition, within reason, rather than monopoly, is in the public interest. The foregoing will be recognized as a close paraphrase of portions of the report in the cited case.

Some question is raised in the record as to whether the rates from Bend will be carried by the Southern Pacific (which does not serve Bend) to Klamath Falls, and if so, whether the Oregon Trunk would be compelled to meet such rates. The general basis of rates into the territory, we must presume, will be such as the law requires or permits; and this question is of minor importance.

As compared with the total amount of money involved in the projects covered by these six finance applications, the amount of duplication of investment due to the proposed parallelling of the lines of the Oregon, California & Eastern from the Williamson River to the Sprague River, and thence to Klamath Falls is not considerable. As compared with the investment proposed by the Oregon Trunk, it is considerable; and as compared with that to be made by the Oregon, California & Eastern, it is substantial. The duplication of expense of construction which could be avoided by the joint use of the line of the Natron cut-off from Paunina into Klamath Falls, is substantial, and runs into the millions of dollars. Besides duplication of mileage, the Oregon Trunk would have to construct 34 miles more track than the length of the Natron cut-off would involve. It is understood that the Oregon Trunk proposes its own terminals in Klamath Falls.

2818 It is asserted by the Oregon Trunk that the lines of the Oregon, California & Eastern, present and proposed, would not be suitable for use as part of its proposed through line, but, recognizing the objections to unnecessary railway construction, that it is willing to enter into any suitable arrangement with the Oregon, California & Eastern for joint use of its line, if constructed upon the proper standard. As has been stated, the Oregon Trunk sought and now desires the use of the Natron cut-off between Paunina and Klamath Falls, and the line proposed by the Williamson River and through Bonanza is put forward as a second choice, to keep as far from the Natron cut-off as the configuration of the country permits. The construction from Bend to Paunina would not be warranted, however, if the line from the North terminated there, without access to the Klamath Basin upon the basis usually enjoyed by originating and terminating carriers.

As ancillary to other considerations, it is further urged in behalf of the Oregon Trunk application that the construction of its proposed line would meet the need of a through north-and-south line east of the Cascades for possible military use. This phase was strongly urged in the Oregon commission's case in Docket No. 14392. It was referred to in Consolidation of Railroads, 63 I. C. C. 455, appendix, p. 589, in the report of Professor Ripley:

From a national point of view, the important line, strategically, is the continuation of the north-and-south Deschutes River line to complete another route between the Columbia River and California. It would come out at the southern end by Klamath Falls and so on to a connection at Weed with the Southern Pacific at San Francisco. The larger significance of this project is that it would provide the Pacific coast with at least two through lines of railway to connect California and Washington. Southern California has three railroads north and south, parallel to the coast. Northern California and Oregon, at the narrowest point in Oregon, have only one complete through line. Two railroads are built part way, but from Tehama to Eugene there is but a tenuous line of communication. A trestle blown up, or a tunnel wrecked, in time of war would compel military communication to take place by encircling the entire huge triangle east to the Great Salt Lake. The need of such another interior north-and-south line of communication was clearly demonstrated in the late war. North, in Washington, the military necessities are adequately covered.

The importance from the standpoint of national defense of a north-and-south military communication lateral sheltered line of railroad was brought before us and considered in Construction of Line by Wenatchee Southern Ry. Co., supra, at page 249. See also Construction of Line by Rio Grande City Ry. Co., 90 I. C. C. 583, 588.

This phase of the matter is confirmed by an officer assigned to present the views of the War Department. Adequate railroad communication between strategic areas is the strongest link in the national defense. A distance of nearly 500 miles between the important strategic areas of central California and the Columbia River
2819 Basin is said to be the weakest, from a military point of view, of any in the whole country, dependent, as it is, upon the single railroad west of the Cascade Mountains described in the foregoing quotation. This is due not only to the rugged character of the country traversed but also to its proximity to the coast and accessibility by raiders. Upon the construction of a railway line or lines connecting Bend with Klamath Falls, and the broad-gauging of the Nevada-California-Oregon, and the construction of the line between Klamath Falls and Alturas embraced in finance dockets Nos. 4914 and 5111, there would be standard-gauge railroads extending from the Canadian border to the Mexican border, sheltered from the Pacific coast by the rugged Cascade, Sierra Nevada, and southern California mountain ranges, which would connect at inland points with all the transcontinental lines. This would immeasurably strengthen the national defense system.

A lumber company now operating at Bend has a logging road extending about 14 miles southward from Bend, approximately on the route of the proposed line, and a witness states that it is the intention to construct additional logging track in the same direction to a point some miles north of the Natron cut-off. This logging road, present and prospective, is of standard-gauge, and the line might be converted into a road capable of carrying the traffic that might be required, if time afforded for its construction when the emergency arose.

It would, however, be a private carrier, not available for use by shippers as a part of a through route in interstate commerce without first obtaining a certificate from us under the act, and not available to the Government in times of war except as commandeered by the President under the war powers. The proposal of the Oregon Trunk is to construct a line within a time limited which will be available for both civil and military purposes under the restrictions and upon the terms as to use contained in the interstate commerce act and other applicable provisions of law.

Finance dockets Nos. 4914 and 5111. Applications of Central Pacific ["Modoc Northern" line]

The third application in the series, finance docket No. 4914, was made by the Central Pacific Railway Company for authority to construct a line of railroad connecting with its Klamath Falls line near Klamath Falls, Ore., and extending thence southeasterly to a point near Cornell, Modoc County, Calif., about 40 miles. Subsequently, the request was modified with respect to the route, reducing the distances to about 36 miles. Applicant states that one of the purposes of the proposed line was to form part of a through line connecting its lines in Oregon with its main line between San Francisco and Odgen, using the Nevada-California-Oregon Railway when reconstructed as a part of the connecting line. The line to Cornell has been long under consideration. It will serve an area of about 462 square miles, or 296,000 acres, of which 153,000 acres are irrigated and under cultivation, being a part of the so-called Klamath irrigation project of the United States Reclamation Service. In addition, 31,000 acres are in process of reclamation, 62,000 acres are subject to future reclamation, and 150,000 acres consist of pasture and dry farming land. There is no timber. The population of the territory is estimated at about 2,400, excluding Klamath Falls. It is expected that the land will be colonized rapidly, and that in a few years there will be perhaps 3,500 2820 families, each cultivating from 40 to 80 acres of land. It is represented that the freight traffic of this line will consist chiefly of agricultural products and livestock, which should find a market in the San Francisco Bay District and at Portland. The line is expected to be profitable as a feeder of the Southern Pacific but not directly profitable in itself. The cost is estimated at $1,518,332, exclusive of equipment. The method of financing had not been decided at the time of the application.

By the sixth application in the series, finance docket No. 5111, the Central Pacific seeks permission to construct a line from Cornell to Alturas, also in Modoc County, Calif., where it will connect with the line of the Nevada-California-Oregon, thus completing a through line from Klamath Falls to Alturas, a total distance of about 99 miles. The record indicates that the territory between Cornell and Alturas will not produce a great amount of local tonnage, but that its principal value will be as part of a through route between western Oregon and the main line of the Southern Pacific extending eastward from San Francisco. The cost of this portion of the line is estimated at $4,921,892. Of the tributary territory, it is said that about 30% is in timber, 20% is grazing land, and 50% is barren. For about 12 miles from Cornell the country is nearly level, but rises about 700 feet in the succeeding 21 miles, descending nearly to the former level before reaching Alturas. Eighty-pound rail will be used and it is expected that the road will be completed within two years. As in the case of the line between Klamath Falls and Cornell, the method of financing had not been determined.

For reason stated in an early portion of this report, we will give consideration to the last-described application in connection with the other proceedings pending before us.

Finance Docket No. 4924. Application of Southern Pacific Co.
[Control of Nevada-California-Oregon Railway]

Fourth in the list of applications was that filed by the Southern Pacific Company for authority to acquire control of the Nevada-California-Oregon Railway by purchase of capital stock. This application was filed pursuant to a contract executed April 30, 1925, between the Southern Pacific and Charles Moran, the latter representing the owners of all the capital stock and bonds of the Nevada-California-Oregon. As already stated, the Nevada-California-Oregon is a narrow-gauge line extending from Wendel, Calif., a point on the main line of the Southern Pacific, northerly to Lakeview. The line has functioned principally as a feeder for the Southern Pacific, and for many years has operated under financial difficulties. Its circumstances are discussed in considerable detail in Nevada-California-Oregon divisions, 73 I. C. C. 330, in which case we required and increase in the carrier's divisions on through traffic interchanged with the Southern Pacific, and in abandonment by Nevada-California-Oregon Railway, 72 I. C. C. 433, in which we authorized the abandonment of 16 miles of the carrier's line forming a connection with the Western Pacific.

It is the purpose of the Southern Pacific, should its present application be granted, to standardize the line, using secondhand rail and making certain line changes and reductions of grade and curvature which will fit the line for service as part of a through route between western Oregon and Wendel. Although only that portion of

the line south of Alturas would be part of such route, it is expected to standardize the northern portion of the line also, fitting it
2821 for the operation of standard equipment with a view to transportation of the timber products of the territory tributary to Lakeview and the territory west thereof, to be served by the proposed Lakeview extension of the Oregon, California & Eastern. The cost of the line changes between Alturas and Wendel is estimated at $1,779,000 and between Alturas and Lakeview, $956,000.

The contract between the Southern Pacific and Charles Moran provides that Moran shall sell the $975,000 of 6 per cent mortgage bonds of the Nevada-California-Oregon to the Southern Pacific for $448,000, face value, in 5 per cent bonds of the Pacific Electric Railway Company, a subsidiary, and $487,000, face value, in 4 per cent bonds of the Los Angeles Pacific Company. The latter are guaranteed by the Southern Pacific, principal and interest. Moran is to deliver all the common stock of the Nevada-California-Oregon, amounting to $1,450,000, face value, to the Southern Pacific for one dollar. He agrees to clear the property of taxes and other liabilities as of the date of transfer. Moran also agrees to sell the Nevada-California-Oregon preferred stock, $750,000 par value, to the Southern Pacific, on its demand at any time within four years from the date of the agreement, accepting in payment therefor $338,000, face value, in 5% bonds of the Pacific Electric Railway Company and $337,000, face value, in four per cent bonds of the Los Angeles Pacific Company. The Southern Pacific agrees, on demand from Moran within the four-year period, to buy the $750,000 preferred stock, giving in payment therefor $200,000, par value, of each of the above-described issues of bonds. It is further agreed that until the Southern Pacific Company or its nominee acquires the preferred stock of the Nevada-California-Oregon, the present divisions of rates between the two companies shall be continued. The Southern Pacific further agrees to use its best efforts to establish divisions fair to the Nevada-California-Oregon in connection with the interchange of traffic with any other lines that may hereafter connect with the Nevada-California-Oregon. The contract contemplates that the standardization shall be completed within five years. The Nevada-California-Oregon is to continue under the exclusive control and management of its present stockholders until the contract is made effective, and that thereafter the Southern Pacific shall assume the responsibility of providing certain officers in charge of its operations.

The contract contains other provisions not considered necessary to this discussion. Both classes of stock of the Nevada-California-Oregon have voting rights and it would therefore appear that the Southern Pacific will secure control regardless of the immediate transfer of the preferred stock. The total cost to the Southern Pacific of control of the line, as standardized, will be either $4,110,000 or $4,385,000, depending upon the exercise of the options for transfer of the preferred stock. The balance sheet of the Nevada-California-Oregon, dated April 30, 1925, shows a total investment in road and equipment of $3,225,919.

Finance Docket No. 4941. Application of Southern Pacific Co. [Control of Oregon, California & Eastern Railway]

Fifth in the series of applications was that of the Southern Pacific Company for authority to acquire control of the Oregon, California & Eastern Railway by purchase of capital stock. The application was filed pursuant to a contract executed February 3, 1925,
2822 between the Southern Pacific and Robert E. Strahorn, the present owner of the line. The line of the Oregon, California & Eastern, otherwise known as the "Strahorn Line," was projected in 1915. Its promoter was assisted in its construction through the supply of rail and other material by the Southern Pacific, which recognized it as a prospective feeder. The application recites that the Southern Pacific Company has acquired and owns "slightly less than a majority" of the capital stock and all of the outstanding first mortgage bonds of the Oregon, California & Eastern, and now seeks approval of the purchase of the remainder of the stock. The contract provides, among other things, that the Southern Pacific Company shall advance money to pay the floating debt of the Oregon, California & Eastern and shall furnish that company such material as may be required within three years for such improvements and extensions as may be agreed on; the Oregon, California & Eastern to repay the money advanced and the value of the material, with interest at 6 per cent, with funds obtained from a new issue of bonds. The Southern Pacific will have the option of taking the bonds at their market value instead of cash, and if they cannot be sold for more than 85 per cent, plus interest, the Southern Pacific is obligated to take them at that price. The Southern Pacific agrees to maintain equitable rate divisions and to furnish equipment, so far as consistent with its own needs. In return, the Oregon, California & Eastern agrees to route its traffic by the Southern Pacific, as far as possible. Strahorn agrees to sell, and the Southern Pacific to buy, one-half of the $600,000, par value, outstanding capital stock of the Oregon, California & Eastern, at cost, not to exceed, however, $65 a share. Strahorn will sell, and the Southern Pacific will buy, at $850 per $1,000 bond, so many of the Oregon, California & Eastern's outstanding bonds as Strahorn can acquire at that price. The Southern Pacific shall have the option of refunding the bonds with bonds of the new issue of equal par value, for which they may be exchanged at any time under out authority. Strahorn is not to sell his remaining stock for one year, and should he wish to sell any part of it thereafter, he must offer it to the Southern Pacific, which shall buy it at $65 a share, cash, plus $35 a share as compensation for Strahorn's services in developing the property. At any time after three years from the date of the contract, the Southern Pacific may call on Strahorn to sell it his remaining shares on the same terms. Both parties agree to contribute, in proportion to their stock ownership, any amounts that may be necessary to meet bond interest, taxes, and operating deficits.

The price to be paid by the applicant for the property as it now exists appear to be approximately as follows:

$300,000 capital stock at not over 65%	$195,000
300,000 " " " 65% plus 35%	300,000
550,000 bonds at 85%	467,500
Floating debt (approximately)	225,000
Total	1,187,500

This purchase does not include $300,000 of so-called income mortgage bonds owned by the city of Klamath Falls, which are to draw interest at the same rate as may be paid in dividends on the stock. The executive vice president of the Southern Pacific testified that in his opinion the Southern Pacific could not reproduce the property of the Oregon, California & Eastern for the price agreed upon. The applicant, however, has made no detailed estimate of the cost of reproducing the property. The owner testified that the actual money invested in the Oregon, California & Eastern, exclusive of donated land, was about $1,200,000. The price to be paid is probably reasonable.

2823 According to the record the total cost to the Central Pacific and its lessee, the Southern Pacific, of accomplishing the various plans proposed in its pending applications will be about $15,000,000. The estimates of traffic and revenue indicate a net revenue of $507,000 for the third year of operation under the proposed plan. The Natron cut-off is not included in these estimates. Between eastern Oregon and Fernley, Nev., and points east, the route by way of the new line through Klamath Falls and Alturas will be 217 miles shorter than the present route by way of Roseville, Calif., and it is expected that this route will be principally used for the movement of traffic to and from western Oregon. The applicant computes that this change of routing will result in the saving of $432,000 a year in expense, thus effecting a return of $939,000 on the investment of $15,000,000, or about 6¼ per cent per annum. It is expected that the new line will also be of benefit to the public as part of the through rail route east of the Cascades for possible military use. Consideration has been given by the applicant to the practicability of effecting arrangements with the Western Pacific Railway Company whereby the Southern Pacific will be able to use the line of the former between Flanigan and Weso, Nev., thus further reducing the distance 51 miles, making a total saving of 268 miles as compared with the route by way of Roseville. There is at present joint operation by the two companies between Weso and Alazon, Nev.

Conclusions

The foregoing statement of facts has necessarily been prolonged. Our task in determining the issues has been simplified by the proposals put forward by the carriers. There is no question, such as confronted us in the Wenatchee Southern Case, supra, as to the stability of the financial structure of any of the carriers, or as to their general results

from operation. The most unfavorable view of the various projects could be taken, and yet, if all of them were consummated, the ability of the major systems to serve the public adequately would be but inconsiderably impaired thereby. Much of the complaint made by the Oregon Commission, with the important exception of the cross-state line, has been met or will be avoided by our favorable action upon the finance docket applications before us, or some of them. Knowing this, we are unable to find and conclude that the record establishes that the extension by the Union Pacific or its subsidiaries of the line from Harriman to the Natron cut-off is required by the public convenience and necessity, under the limitations imposed by the act.

The general principles which are to guide us are not difficult to establish. Congress has undertaken to develop and maintain, for the people of the United States, an adequate railroad system. It has recognized that as to individual carriers the preservation of the earning capacity, and conservation of the financial resources is a matter of national concern; that the property employed must be permitted to earn a reasonable return; that the building of unnecessary lines involves a waste of resources, and that the burden of this waste may fall upon the public; that competition between carriers may result in harm to the public, as well as in benefit; and that, when a railroad inflicts injury upon its rival, it may be the public which ultimately bears the loss. Texas & P. R. Co. *v.* Gulf, C. & S. F. Ry. Co. —— U. S. —— (Mar. 1, 1926). Our conclusions herein are intended to accomplish such undertaking, and to avert such losses.

2824 Here the conclusion is inescapable that the system proposed by the six finance applications as in the public interest, and is of public convenience and necessity. But it is clear that the public necessity can be met with equal convenience, if a large amount of expenditure be avoided by utilization, on fair and lawful terms, of existing facilities of the applicants, or those to be constructed, in such manner as to give substantially the same service as if all the lines involved were constructed. The duty of the carriers is plain, under a more pronounced policy of cooperation and coordination, to give interior Oregon railroad access to both the north and the south, and the benefits of reasonable competition, in such manner as to afford the greatest service consistent with the minimum of expenditure to accomplish such purpose. This will reduce the operating and carrying charges of all of the applicant railroads, and will not materially impair the service any of them affords, or deprive any carrier of substantial rights or rewards for its enterprise and investment. We shall endeavor to attach conditions to the certificates to be issued herein to accomplish such result, as required by the public convenience and necessity. The heretofore existing policy of the western carriers is in marked contrast with that which obtains in other sections of the country, and should be revised with a view to more intensive use of the transportation machine existing, and the avoidance of unnecessary expenditures in future development. But even in the west, there are

many notable examples of joint use of important sections of track, with success. The recent arrangements for joint use of portions of the Southern Pacific and Western Pacific, and the suggestion by the Southern Pacific for a further development of that joint use in connection with its Modoc Northern project in the record before us, aptly illustrate what can be accomplished when the will is present. The Great Northern, Northern Pacific and Oregon-Washington, parties to the record before us, use the same tracks between Portland and Seattle, Wash., certain minor mileage unconsidered. The Northern Pacific and Oregon-Washington appear to own and operate certain lines in Washington and Idaho, and to be contemplating the joint construction of other, intended, as here, to develop important timber areas. These are specified merely as illustrations. The record is not convincing that the mere use by the Oregon Trunk of the Natron cut-off between Paunina and Klamath Falls would interfere with the use of the cut-off by the Southern Pacific for the principal purposes for which it was constructed.

While the attitude of the Union Pacific system as to the cross-State line is openly adverse to the requirement that it construct such line under the present conditions of ownership of the Natron cut-off and the Willamette Valley lines, yet a careful scrutiny of its position in the light of its past construction leads to the conclusion that under appropriate circumstances it would complete that portion of its historic plan which is represented by the gap between Harriman and the cut-off. In no other way now known can its great investment from Ontario to Burns be made to yield its running and fixed costs. In this respect its situation is similar to that of the Oregon Trunk at Bend, with a high grade line 151 miles long, an incomplete fragment of a larger plan, built on standards contemplating a greater use than it can have if unextended. But the Union Pacific is making no suggestion to us for an extension of its lines; rather, as stated, it opposes an order requiring it to do so. Its opposition is doubtless due in major part to its apprehensions as to the treatment it would receive in the division of traffic, if and when it should reach the Natron
2825 cut-off, which soon is to become a main line of the Southern Pacific. What the Union Pacific could be required to do, upon this record, against its protest, is one thing. Our conclusion, previously expressed, is that the record in the Oregon commission case cannot be depended upon to speak clearly as to the future traffic and its financial results, because of conditions changed since that record was made. This makes it unnecessary to determine the important questions of constitutional authority and of statutory construction raised. But it is another matter as to what we should permit the Union Pacific to do upon the present record, were it convinced of the business soundness of the project for the extension of its rails as long ago planned, to a connection with the Southern Pacific's line. We do not intimate what our determination of that question would be if an application by the Union Pacific were before us. It is, however, appropriate because of the great importance of the subject and the

changes which have occurred since the Union Pacific was before us as a defendant to the Oregon commission's complaint, to suggest to that carrier a most careful review and survey again of the entire situation, in the light of the known facts, our present determination, and the policy of the law as it applies to connecting carriers. The Union Pacific has not come into the hearings upon any of the six pending finance applications, and what its position may be as to its duty in the development of the great section of the country under consideration, as now planned, we are not informed. In its review, it may properly take into consideration the feasibility of participation in the traffic through joint trackage arrangements with the Oregon Trunk. The president of the Great Northern Railway Company, testifying for the Oregon Trunk, strongly advocated a policy of cooperation which would result in the maximum of service with the minimum of construction. The Oregon Trunk, in brief and argument, affirmed this view.

An order and certificate will be entered dismissing the complaint of the Public Service Commission of Oregon, in No. 14392; authorizing the construction and operation sought by the Central Pacific Railway Company for its Modoc Northern line, in finance dockets No. 4914 and 5111; authorizing the acquisition of control of the Nevada-California-Oregon Railway by the Southern Pacific Company; conditionally authorizing the construction of the lines sought by the Oregon Trunk Railway and Oregon, California & Eastern Railway Company in finance dockets Nos. 4810 and 4730, respectively; and conditionally authorizing the acquisition of control of the latter company by the Southern Pacific Company, as sought in finance docket No. 4941.

The Oregon Trunk will be authorized to construct its proposed line from Bend to a connection with the line of the Oregon, California & Eastern, subject, however, to the condition that should it be granted trackage rights over the Southern Pacific line between Paunina and Klamath Falls, it shall construct only to a point of connection with the Natron cut-off; and the authority given the Oregon, California & Eastern to construct its proposed extensions will be conditioned upon its grant to the Oregon Trunk of operating rights over its line, present and proposed, between a point of connection and Klamath Falls, if the Oregon Trunk should fail to reach an agreement with the Southern Pacific for joint operation over its line. The authorization of the Southern Pacific to acquire control of the Oregon, California & Eastern will also be conditioned upon the consummation of an arrangement whereby the Oregon Trunk will be enabled to operate either over the Natron cut-off or the line of the Oregon, California & Eastern.

2826 These conditions are found to be for the public convenience and necessity. No attempt will be made to prescribe details of the arrangement, which must be left to the carriers, but we shall be glad to use our offices in bringing about the desired result. In view of the importance of the matter, and the exigencies of construction, we shall expect the various carriers to undertake in good faith to come

to an understanding which will carry out our conclusions, with no unnecessary delay, or to notify us promptly of their rejection of the terms and conditions imposed. The record will be held open for such further proceedings and orders as may be necessary.

Authority to retain excess earnings under section 15–A of the act will be denied in each case where it is sought herein.

Meyer, commissioner, concurring.

I concur in the results but can not indorse all that is said in the report about competition and military considerations as a reason for new construction of railroads.

The increased tonnage of lumber which the country will demand from the Pacific Northwest and the other traffic that it is known will accompany an increase in the lumber traffic justifies a certain amount of new railroad mileage and new arrangements for the operation of some of the old and new mileage. It is necessary and proper that adequate provision should be made for this future development as far as its extent can reasonably be determined at this time, although the actual development which will take place in the future will demonstrate whether the program which we are approving in this report is somewhat premature. In the prospective tonnage lies the justification for what we are doing. The introduction of competition in a different form and in a territory where it does not now exist to the extent which some regard as desirable is an elusive and theoretical consideration upon which much emphasis is laid in the report but which railroad development everywhere in this and in other countries has demonstrated to be unsound. The theory of competition as applied to railroads and a more or less dogmatic reliance upon it has been in my judgment the greatest single error in our national policy towards railroads. The undue stress which this report lays upon competition tends to perpetuate this fallacy.

Under paragraph (18) of section 1 of the act we are empowered to authorize the construction of new railroads or the extension of existing railroads upon a showing of public convenience and necessity. The purpose of this provision, as is well understood, was that the construction of useless and harmful mileage should cease and that only such new mileage should be created as would add to the utility and efficiency of our national system of transportation. Unless sound transportation considerations justify new construction we have no right under the law to authorize it. No decisive weight can be attached to military considerations and under no circumstances can these considerations alone justify new construction under our authority. Congress did not authorize us to promote a military system of railroads. Many existing railroads years ago incurred military obligations through their acceptance of land grants. Congress has not created a fund out of which subsidies might be paid for the support of new railroad mileage which might be thought necessary from a military

standpoint but which could not be justified from a transportation standpoint. If Congress had authorized us or the War Department or some other agency to make available a certain number of dollars per mile of railroad to be constructed partly or chiefly for military purposes we could add the amount of this subsidy to the estimated amount of earnings from the carriage of freight and passengers and in that way arrive at a conclusion with respect to the ability of the proposed new railroad to live and become a healthy part of our national system. But no such provision has been made. I am not willing to say that it should be. Unless a railroad can be justified purely and solely for transportation reasons we have no right to authorize its construction even though military men may testify regarding the desirability from a military standpoint of such construction. We are without power to authorize or require the construction of military railroads. The exercise of our power must be justified upon other grounds. Military considerations may constitute an added advantage.

2827

Several references are made in the report to the Wenatchee Southern case, 90 I. C. C. 237. The views expressed in the report in that case have never received the approval of a majority of the commission. Five commissioners only approved the report proper, one concurred in the results, and five dissented.

Woodlock, commissioner, concurring.

The report in the instant case disposes of the various applications in a manner which, things being as they are, is in the main justifiable. The Oregon Railroad Commission does not get its cross-State line, but it does get the material for a new and shorter route to the east by a continuation of the Natron cut-off in a southeasterly direction to a connection with the Nevada-California-Oregon at Alturas. The northern lines obtain entry into the Klamath Falls pine timber on the theory that a great early increase in lumber production in that district is imminent. It is to be noted, however, that this increase in production is predicated upon a rapid clearance of the pine timber in private ownership, and not upon the system of cutting which the Government had adopted in connection with Government timberlands, and it is a grave question whether the public interest will, in the long run, be served by this arrangement. The Southern Pacific lines obtain entry into the pine timber tributary to Lakeview and Silver Lake. Save for the entry of the northern lines into Klamath Falls the "Southern Pacific monopoly" in Oregon remains unbroken. The situation viewed as a whole is interesting as bearing on the question of "railroad competition" under the transportation act, and is, perhaps, deserving of a brief comment.

Congress has enjoined upon the commission the duty of "preserving competition" as far as possible in the grouping of railroads through consolidation. If, however, it had desired to introduce yet more "competition" into the industry, through control in the hands of this commission over new construction and extensions, it would doubtless have instructed us to that effect, instead of referring us to "public

convenience and necessity" as the test to be applied to new projects. "Competition" means alternative service available to a shipper or a district; it implies existence at all times of more facilities than are actually needed to move the traffic. The law clearly contemplates that railroad plant in existence shall, as a whole, receive a "fair return" from the rates. It is impossible, therefore, to avoid the conclusion that when Congress gave us power to govern new construction it did so with the intent that we should prohibit the building of
2828 unnecessary new facilities. New facilities become necessary when existing facilities become inadequate. "Monopoly" is not necessarily synonymous with inadequacy. "Competitive" facilities are not "necessary" merely because they are "competitive." Doubtless, every shipper is ready at all times to welcome another railroad into his territory; doubtless every railroad is ready at all times to enter another railroad's territory and share the business that the other has developed; doubtless no railroad desires a new "competitor"; these are all very natural states of mind. But somebody must pay for the new facilities and they must be supported by the rates. There is no purse of Fortunatus to be tapped; both carrier and shipper may well bear that in mind.

In choosing, moreover, a system of private ownership with private management, and in relying upon private initiative for good railroad service and timely railroad development under a system of regulation based on the "cost-of-service" principle, Congress, doubtless deliberately, elected to take the disadvantages with the advantages, believing that results on balance would justify the choice. Prominent among the disadvantages is, no doubt, the principle of retention by the carrier of the "long haul" over its own lines, which leads to a certain amount of wasteful transportation. This, however, seems to be a necessary concomitant of transportation by individual carrier systems privately owned and operated, and is specifically recognized, in principle, by the act. The fatal flaw in the Oregon commission's proposals arises from this fact. We can not require the Union Pacific to build west across central Oregon to connect with Southern Pacific when the investment would have to depend for return mainly upon traffic to be received from the Southern Pacific at the expense of its own long haul, which traffic the Southern Pacific would not voluntarily surrender. We can not under the law compel such surrender. The "long haul" principle may result in some waste of transportation service, but it is a necessary principle in the system of private ownership and management of individual systems of railroads, and we can not have the latter without the former. Congress made its choice of systems and has legislated accordingly, and it is our duty to give effect to both spirit and letter of the law as it stands, using neither to nullify the other. Our disposition of the applications covered in this report (with a possible exception in the case of the entry of the northern lines into the Klamath Falls basin) seems to me to accord fairly well with both.

Taylor, commissioner, concurring.

The portion of section 1 of the act, in regard to the issuance of certificates of public convenience and necessity with respect to the construction or extension of lines of a railroad, reads in part as follows:

(18) * * * no carrier by railroad subject to this act shall undertake the extension of its line of railroad, or the construction of a new line of railroad, or shall acquire or operate any line of railroad, or extension thereof, or shall engage in transportation under this act over or by means of such additional or extended line of railroad, unless and until there shall first have been obtained from the commission a certificate that the present or future public convenience and necessity require or will require the construction, or operation, or construction and operation, of such additional or extended line of railroad,

* * *

2829 In performing the duty imposed by this statute, this commission can not bring to its aid any facts bearing upon the volume of new traffic which may follow the development of territory to be occupied by the construction of an addition or an extension to a line of railway which are susceptible of exact demonstration. Therefore its conclusions must be based upon an opinion, the merit of which can rest alone upon the methods under which it is arrived at. For this fundamental reason it seems clear to me that when an application is made to this commission for such a certificate, by a person, firm, or corporation presenting conclusive evidence, not only of a desire to make the expenditure, but also of the possession of sufficient funds to do so, this should be looked upon as the weightiest evidence that the enterprise will pay a fair return upon the investment; and when such an application is accompanied by a request from a sufficient number of persons resident of, or interested in, an area of territory great enough to indicate that such additional means of transportation is reasonably required, that the sum of this evidence should be considered highly presumptive, if not conclusive, of the public convenience and necessity for the issuance of such a certificate. It should certainly constitute prima facie evidence of such a necessity, which should endure until refuted by positive evidence to the contrary.

It would seem intolerable, from my viewpoint, that, because a specified territory has been occupied by one particular line of railroad, such carrier should enjoy a perpetual monopoly of its traffic, and that the inhabitants thereof, or those interested in the property located within its borders, should be deprived of railroad competition.

For the above reasons I concur in the conclusion that what has been termed the "northern lines" should be permitted to build into the traffic treasure house of the Klamath Falls pine timber territory, that the residents and all others interested in the traffic to and form this important territory may be enabled to enjoy an enlargement of their facilities to reach sources of their supplies and markets for their products and be given the benefits which will flow from competitive transportation facilities.

I also concur in the conclusion that we should not exercise our jurisdiction under paragraph 21 of section 1 to require the Union

Pacific to construct an extension of its line, which it does not consider necessary or desirable. The showing of public convience and necessity is not sufficient to overcome the objections of that carrier.

McManamy, commissioner, dissenting in part.

The report of the majority states that:

In a broad way, the proceedings dealt with in this report require our answer as to the railroad facilities which shall be afforded eastern Oregon and northern California.

To my mind, our answer to this question does a grave injustice to the State of Oregon and fails utterly to meet the urgent requirements of the people of Oregon and southwestern Idaho for better and more direct transportation facilities. Eastern Oregon, an empire of some 33,000 square miles, lies underdeveloped because of lack of
2830 means of getting its products to market. The need for the cross-State line, as urged by the Oregon commission, has existed for many years and because of this decision it will remain unsatisfied for many years to come. Many cross-State lines have been proposed but the one with which this case deals, proposed some 20 years ago by the Union Pacific, would leave the main line of the Oregon Short Line at Ontario, Oreg., and extend westerly with the ultimate purpose of reaching the coast and not only developing the agricultural country in the center of the State but obtaining a share of the lumber traffic which must flow from the immense bodies of standing timber east and west of the Cascades. About 150 miles of this line was built and is now unprofitable because the original plan was not carried out. After waiting all these years without any substantial increase in the railroad mileage in this portion of the State, the people of the State of Oregon, through their railroad commission, sought an order from us requiring the construction of this line in the interest of the public.

After the case was heard, proposed report circulated, and argument had, the Southern Pacific proposed a series of improvements which it is claimed will take the place of the proposal of the Oregon commission and furnish adequate transportation for that part of the State which requires additional transportation facilities. To my mind the record in this case falls far short of establishing that fact.

The projects involved can be separated into two groups, namely, (1) the cross-State line and branches which constitute the larger part of the Oregon commission program, and (2) the alternative proposals of the Southern Pacific and the Oregon Trunk railroads. This decision denies in toto the complaint of the Oregon commission and in a general way approves the program of the Southern Pacific Railroad and the Oregon Trunk.

My objections go mainly to the disposition here made of the request of the Oregon commission, but some features of the rights granted deserve unfavorable comment because of their ultimate effect. I have no criticism to offer concerning the applications of the Central Pacific in finance dockets Nos. 4914 and 5111 for construction of a short cut from Klamath Falls, Oreg., to Alturas, Calif., a point on the Nevada, California & Oregon Railway. This will afford a shorter

route eastward over the Southern Pacific than the present route via Roseville, Calif.

I have no serious criticism concerning the approval of the application of the Southern Pacific in finance docket No. 4924 for acquisition of the Nevada, California & Oregon Railway, but I think this approval should have carried a reservation of future joint use from Lakeview, Oreg., to Alturas to provide for possible future movement of traffic between eastern and central Oregon on the one hand and central California on the other without unnecessary duplication of facilities.

I am opposed to the approval of the application in finance dockets Nos. 4941 and 4730 by which the Southern Pacific acquires control of the so-called Strahorn lines in the Klamath Basin with the various extensions thereto, because that proposal ties up railroad mileage and available routes in the Klamath Basin to an extent that will make it extremely difficult, if not impossible, for any other railroad to obtain a foothold therein. We properly let the northern lines reach Klamath Falls by approving the application of the Oregon Trunk in finance docket No. 4810, but we then restrict their usefulness by giving the Southern Pacific control of all the surrounding territory.

2831 My chief objection, however, goes to the denial of the complaint of the Public Service Commission of Oregon in docket No. 14392 for an order or orders under paragraph (21) of section 1 of the act requiring construction and operation of the cross-State line and branches. This denial is based on (a) alleged lack of present and potential traffic to support a cross-State line, and (b) the fact that the Union Pacific did not apply for authority to build such a line.

Taking first the question of traffic, the conclusion is expressed "that the record in the Oregon commission case can not be depended upon to speak clearly as to future traffic and its financial results because of changed conditions since that record was made." There are no changed conditions including those which will result from our action in this case which indicate to my mind that the estimates of the Oregon commission were other than conservative. My opinion is that the report of the majority is ultraconservative with respect to present and potential traffic possibilities. Under the head of "potential and probable traffic" reference is made to the Senate resolution of February 4, 1924, in respect to which we made a report transportation facilities in Northwest Pacific States, 87 I. C. C. 472. The purpose for which this reference is made is not evident because our report in that case contains not one word concerning traffic or other conditions in the portion of the State of Oregon dealt with in this case. I shall not attempt to enumerate all of the sources of available and potential traffic in the area to be served by the line proposed by the Oregon commission because the report, conservative as it is, shows ample resources to justify the completion of the project. I can not refrain, however, from quoting from the report the statement that the national forest reserves in eastern Oregon contain timber estimated at 47,000,000,000 feet and privately owned lands contain 29,510,000,000 feet, and that 24 per cent is mature and will deteriorate

rapidly. This means that to-day there are approximately 17,000,000,000 feet of timber in eastern Oregon that is now mature and should be gotten out without delay and that not to exceed 50 per cent of it can be reached by logging roads from the present and proposed lines. In view of the rate at which our timber resources are being exhausted, this situation deserves more consideration than has been given it.

The so-called 75-mile stretch of semiarid territory in the central part of the State is stressed as one of the chief difficulties in the way of the construction of the cross-State line although it is admitted that the construction work would not be unusually heavy. If that were an insurmountable obstacle, which transcontinental line would have ever been built? Each one of them has crossed from four to ten times that distance of semiarid or arid country, some of which has since developed into the most profitable territory served by the line. No more arid country ever existed on earth than the Imperial Valley in southern California, but since transportation has been provided it is one of the most profitable sections served by the Southern Pacific. The same is true of sections in the State of Washington, therefore why should that be stressed as a reason for not giving the admittedly fertile sections of the State of Oregon necessary transportation facilities to permit it to develop in a normal and proper way?

Too much consideration is given to the fact that the Union Pacific failed to file an application for a certificate of convenience and necessity to build the cross-State line proposed by the Oregon commission and also the fact that it did not come into the hearings upon any of the six pending finance applications. I can not, of course, say definitely why the Union Pacific did not file such an applica-
2832 tion, but in view of the close relationship which has for years existed between the Union Pacific and the Southern Pacific its reluctance to invade the territory which is claimed by the Southern Pacific is not at all surprising. It is my opinion that with reasonable traffic arrangements the Union Pacific would welcome an order requiring it to proceed with the construction of the cross-State line. The fact that the Union Pacific did not come into the hearings upon any of the six finance applications is not at all significant. Why should it, as long as it did not itself propose to build into that territory?

The report further states concerning the Union Pacific that:

A careful scrutiny of its position in the light of its past construction leads to the conclusion that under appropriate circumstances it would complete that portion of its historic plan which is represented by the gap between Harriman and the cut-off. *In no other way now known can its great investment from Ontario to Burns be made to yield its running and fixed costs.* (Italics mine.)

We than suggest to the Union Pacific—

A most careful review and survey again of the entire situation, in the light of the known facts, our present determination, and the policy of the law as it applies to connecting carriers.

I do not quite understand what we mean by this statement because as a direct result of the decision in this case every inducement for the

Union Pacific to build into this territory has been rendered less potent. If the Union Pacific has been deterred from building this line because of its doubt as to whether or not it would be permitted to participate in the immense volume of traffic west of the Cascades, surely we can not expect this admonition to have much weight after we have given to other lines a large share of the traffic east of the Cascades, including all in the Klamath Basin and have given no intimation that the present situation west of the Cascades would be changed.

Notwithstanding that the products of western Oregon are such that they normally should move to eastern markets the preponderance of movement of traffic from that section due to the absence of through routes eastward is to California and other territory to the south reached by the Southern Pacific.

The majority report states that the approval of the applications included in this report will give "interior Oregon railroad access to both the north and the south." But this is not what is sought by the people of Oregon and not what the development of the country requires. It is true that within certain limits the products of Oregon will find a market in California and livestock from the interior part of the State will find a market in San Francisco, Portland, or Puget Sound points, but, broadly speaking, the markets needed for the State of Oregon are not to be found in Washington or in California. Both of those States produce to a very great extent the same commodities that are produced in Oregon and both States produce such commodities in excess of their needs. What Oregon needs is, first, development of the interior of the State, and, second, direct routes to intermountain, middle western, and eastern markets. The record shows that there has always been a more or less chronic shortage of freight cars in western Oregon during producing seasons because of its dependence upon one carrier. The report shows that it was admitted by the assistant general manager of the Southern Pacific and amply corroborated by witness for the shippers that
2833 "Oregon is very remote from the center of consumption and is the hardest country in America to get empties into." The report further states:

Shippers of lumber and other commodities in the State of Washington seldom experience car shortages as severe as those met in the Willamette Valley. They enjoy greater carrier competition and in most instances have available the empty cars of more than one system. *The marketing of Oregon timber is languishing in comparison with that of Washington and California.* (Italics mine.)

This is supported by the fact that with 494,000,000,000 feet of standing timber, Oregon in 1920 had an output of but 3,500,000,000 feet, while Washington with but 335,000,000,000 feet of standing timber had an output of 5,500,000,000 feet, with other years in approximate proportion. The reason for this is not hard to find. Washington's advantage lies in the fact that its producers have direct and competitive transportation over four transcontinental lines to middle western and eastern markets while Oregon traffic must largely move via Washington or via California.

Under this decision Oregon in the future, as in the past, will, so far as transportation matters are concerned, continue to be ancillary to Washington and California in that it must continue to be served by branch-line railroads connecting with trunk lines extending through those States. It must continue to suffer the delay to its products and the resulting handicap to its development resulting from the added expense and time involved in reaching eastern markets via circuitous routes because the only east-and-west trunk line which reaches the State failed (for some reason best known to itself) to ask for a certificate of convenience and necessity to authorize it to complete plans made 20 years ago. For this, eastern and central Oregon is denied opportunity for natural development. For this, Harney and Lake Counties must continue for years to wagon their products and drive their cattle hundreds of miles to market. For this, central and western Oregon producers must continue to depend upon one railroad system. Truly they asked us for bread and we have given them a stone.

The State commission's complaint in docket No. 14392 should have been granted or held open for further testimony. The Union Pacific system should have been directed to formulate its plans for the construction of the cross-State project and submit them to us at such further hearing if held. All of the legal conditions antecedent to the issuance of an order for the construction of this cross-State project apparently have been met on the record. It is shown that this line is "reasonably required in the interest of public convenience and necessity" and there is no contention that "the expense involved" will "impair the ability of the carrier to perform its duty to the public." Instead of contenting ourselves with merely granting the applications made, we should have taken constructive action upon this complaint.

2834 Certificate and order

At a General Session of the Interstate Commerce Commission, held at its office in Washington, D. C., on the 3rd day of May, A. D. 1926

No. 14392 [6]

PUBLIC SERVICE COMMISSION OF OREGON

v.

CENTRAL PACIFIC RAILWAY COMPANY ET AL.

A hearing and investigation of the matters and things involved in these proceedings having been had, and the commission having, on the date hereof, made and filed a report containing its findings of

[6] This certificate and order also embraces finance docket No. 4730, construction of lines by Oregon, California & Eastern Ry. Co.; finance docket No. 4810, construction of lines by Oregon Trunk Ry.; finance docket No. 4914, construction of line by Central Pacific Ry. Co. in Klamath Co., Oreg. and Modoc Co., Cal.; finance docket No. 5111, construction of line by Central Pacific Ry. Co. in Modoc Co., Cal.; finance docket No. 4924, acquisition of control of Nevada-California-Oregon Ry. Co. by Southern Pacific Co.; and finance docket No. 4941, acquisition of control of Oregon, California & Eastern Ry. Co. by Southern Pacific Co.

fact and conclusions thereon, which said report is hereby referred to and made a part hereof:

It is hereby certified, That the present and future public convenience and necessity require the construction by the Oregon Trunk Railway of a line of railroad from Bend, Deschutes County, Oreg., by way of Paunina, Klamath County, Oreg., to the nearest practicable point of connection with the line of the Oregon, California & Eastern Railway Company, now constructed or hereafter to be constructed under authority of this certificate, said line of the Oregon Trunk Railway being a portion of the line described in the application in finance docket No. 4810 and in said report: Provided, however, and the certification in this paragraph is given upon the express condition, that if the said Oregon Trunk Railway shall be granted the right to operate over the line of the Central Pacific Railway Company between a point of connection at or near Paunina, Oreg., and Klamath Falls, Oreg., the said Oregon Trunk Railway shall, in such event, construct only that portion of its proposed line extending from Bend, Oreg., to said point of connection with the line of said Central Pacific Railway Company at or near Paunina, Oreg.

It is further certified, That the present and future public convenience and necessity require the construction by the Oregon, California & Eastern Railway Company of lines of Railroad in Klamath and Lake Counties, Oreg., described in the application in finance docket No. 4730 and in said report: Provided, however, and the certification in this paragraph is given upon the express condition, that if the said Oregon Trunk Railway shall not be granted right to operate over the line of said Central Pacific Railway Company, as hereinbefore provided, the said Oregon, California & Eastern Railway Company shall grant the said Oregon Trunk Railway right to operate over the line of the said Oregon, California & Eastern Railway Company
2835 between a point of connection as aforesaid and Klamath Falls, Oreg.

It is further certified, That the present and future public convenience and necessity require the operation by the Oregon Trunk Railway, under trackage rights, over such parts of the lines of the Oregon, California & Eastern Railway Company or the Central Pacific Railway Company as may be determined under the provisions of this certificate and order.

It is further certified, That the present and future public convenience and necessity require the construction by the Central Pacific Railway Company of lines of railroad in Klamath County, Oreg., and Modoc County, Cal., described in the applications in finance dockets Nos. 4914 and 5111 and in said report.

It is ordered, That no construction by the Oregon Trunk Railway south of Paunina, Oreg., or by the Oregon, California & Eastern Railway Company, authorized herein, shall be commenced until there shall have been filed with this commission a copy of the contract or agreement, granting the right of operation by the Oregon Trunk Railway over the line of the Central Pacific Railway Company or the

line of the Oregon, California & Eastern Railway Company, as hereinbefore provided for.

It is further ordered, That each railway company herein authorized to construct a line or lines of railway shall commence such construction within one year from the date hereof and shall complete the same within three years from the date hereof, and shall report to this commission in writing, within 15 days thereafter, the time of such commencement and completion, respectively.

It is further ordered, That each railway company herein authorized to construct a line or lines of railway, when filing schedules establishing rates and fares applicable on such line or lines, shall in such schedules refer to this certificate and order by title, date, and docket number.

It is further ordered, That all requests in the said proceedings for permission to retain excess earnings be, and they are hereby, denied.

It is further ordered, That the acquisition by the Southern Pacific Company of control of the Oregon, California & Eastern Railway Company by purchase of capital stock, as described in said report, be, and it is hereby, approved and authorized: Provided, however, and this authorization is upon the express condition, that the Oregon Trunk Railway shall be granted right to operate over the line of the Central Pacific Railway Company, or over the line of the Oregon, California & Eastern Railway Company, as aforesaid.

It is further ordered, That the acquisition by the Southern Pacific Company of control of the Nevada-California-Oregon Railway, by purchase of capital stock, as described in said report, be, and it is hereby, approved and authorized.

It is further ordered, That the record be held open for such further proceedings or orders as may be found necessary.

And it is further ordered, That the complaint of the Public Service Commission of Oregon, as recorded in docket No. 14392 and described in said report, be, and it is hereby, dismissed.

By the commission.

[SEAL.] GEORGE B. McGINTY,
Secretary.

2836 *Defendant's Exhibit A*

U. S. District Court, District of Oregon. Filed September 29, 1930, G. H. Marsh, clerk, by W. L. Kenyon, deputy.

2837 Articles of Incorporation of Oregon-Washington Railroad & Navigation Company

Know all men by these presents:

That we, R. B. Miller, R. Koehler and M. J. Buckley, the undersigned, all of Portland, Oregon, do hereby associate ourselves as a corporation under the laws of the State of Oregon, and do hereby adopt the following articles of incorporation, to wit:

Article I

The name of the corporation shall be Oregon-Washington Railroad & Navigation Company.

Article II

The duration of the corporation shall be perpetual.

Article III

The enterprise, business, pursuit, or occupation in which this corporation proposes to engage shall be:

First: To purchase, acquire, own, hold, construct, complete, equip, maintain, and operate the railroads, railroad property and telegraph lines hereinafter mentioned, with their appurtenances, and to
2838 carry freight and passengers thereon, and to receive tolls for such carriage, and in all things, and in every lawful manner, to exercise the powers, privileges, franchises and functions of a railroad company and of a common carrier in respect to each and all of such lines, to wit:

1. All of the constructed railroad and telegraph lines now owned by the Oregon Railroad and Navigation Company, namely: (a) A line from Portland, in the State of Oregon, to Huntington, in said State; (b) a line from Umatilla junction, in the State of Oregon, via Wallula, in the State of Washington to Walla Walla in the State of Washington; (c) a line from Pendleton, in the State of Oregon, via Walla Walla and Colfax to Spokane, in the State of Washington; (d) a line from Heppner junction, formerly known as Willows junction, in the State of Oregon, to Heppner, in said State; (e) a line from La Grande, in the State of Oregon, via Elgin and Wallowa to Joseph in said State; (f) a line from Starbuck, in the State of Washington, to Pomeroy, in said State; (g) a line from Connell, in the State of Washington, to La Crosse, in said State; (h) a line from Colfax, in the State of Washington, to Moscow, in the State of Idaho; (i) a line from Bolles junction, in the State of Washington, via Dayton, to Turner, in said State; (j) a line from Winona junction, in the State of Washington, to Seltice, in said State; (k) a line from Tekoa, in the State of Washington, to Mullan, in the State of Idaho; (l) a line from Wallace, in the State of Idaho, to Burke, in said State; (m) a line from Sierra Nevada junction, in the State of Idaho, to Sierra
2839 Nevada mine, in said State; (n) a line from Fairfield, in the State of Washington, to Waverly, in said State.

2. The railroad and telegraph line of the Oregon Railroad and Navigation Company from Portland, in the State of Oregon, via St. Johns, to Troutdale, in said State, and in connection therewith a cut-off by a tunnel through the peninsula between the Columbia and Willamette Rivers, a part of said line being now constructed, and the remainder being under construction.

3. A railroad and telegraph line from Portland, in the State of Oregon, on some eligible route to be hereafter selected, to a point at or near the mouth of the Columbia River on either the north or south side of said river, no portion of which has been constructed, but which is mentioned and described in the articles of incorporation of the Oregon Railroad and Navigation Company.

4. A railroad and telegraph line from Coyote, in the State of Oregon, to Stanfield, in said State, none of which has been constructed, but which the Oregon Railroad and Navigation Company proposes to construct.

5. The railroad and telegraph line owned and now under construction by Des Chutes Railroad Company from Des Chutes station, on the line of the Oregon Railroad and Navigation Company, in the State of Oregon, to Bend, in said State, and all of the interest, estate, right, possession and use of Des Chutes Railroad Company in and to any part of the railroad and telegraph line of Oregon Trunk Railway between said Des Chutes station and Bend, in the State of Oregon.

2840 6. The constructed railroad and telegraph line now owned by Columbia Southern Railway Company extending from a point at or near Biggs station, in the State of Oregon, to Shaniko, in said State.

7. The constructed railroad and telegraph line now owned by Columbia River & Oregon Central Railroad Company, extending from Arlington, in the State of Oregon, to Condon, in said State.

8. The constructed railroad and telegraph line now owned by Umatilla Central Railroad Company, extending from a point on the line of the Oregon Railroad and Navigation Company near Pendleton, in the State of Oregon, to Pilot Rock, in said State; and the railroad and telegraph lines projected and proposed to be constructed by Umatilla Central Railroad Company, namely: (a) A line from a point at or near Pilot Rock, in the State of Oregon, on such route as may be selected by the board of directors, to a point at or near the confluence of Snake Creek and the north fork of John Day River, in the State of Oregon; (b) a line of railroad from a connection with the last-named railroad line at or near the confluence of Bear Creek and Birch Creek, in Umatilla County, Oregon, to a point on Camas Creek, at or near the confluence of Camas Creek and Hideway Creek, in said State.

9. The constructed railroad and telegraph line now owned by Snake River Valley Railroad Company, from Wallula, in the State of Washington, along the Snake River to Grange City, in said State.

2841 10. The constructed railroad and telegraph line of Oregon, Washington & Idaho Railroad Company extending from Lewiston junction, in the State of Washington, to Lewiston, in the State of Idaho, and all of the interest, estate, rights, possession, and use of Oregon, Washington & Idaho Railroad Company in and to the railroad and telegraph line owned by Northern Pacific Railway Com-

Article I

The name of the corporation shall be Oregon-Washington Railroad & Navigation Company.

Article II

The duration of the corporation shall be perpetual.

Article III

The enterprise, business, pursuit, or occupation in which this corporation proposes to engage shall be:

First: To purchase, acquire, own, hold, construct, complete, equip, maintain, and operate the railroads, railroad property and telegraph lines hereinafter mentioned, with their appurtenances, and to
2838 carry freight and passengers thereon, and to receive tolls for such carriage, and in all things, and in every lawful manner, to exercise the powers, privileges, franchises and functions of a railroad company and of a common carrier in respect to each and all of such lines, to wit:

1. All of the constructed railroad and telegraph lines now owned by the Oregon Railroad and Navigation Company, namely: (a) A line from Portland, in the State of Oregon, to Huntington, in said State; (b) a line from Umatilla junction, in the State of Oregon, via Wallula, in the State of Washington to Walla Walla in the State of Washington; (c) a line from Pendleton, in the State of Oregon, via Walla Walla and Colfax to Spokane, in the State of Washington; (d) a line from Heppner junction, formerly known as Willows junction, in the State of Oregon, to Heppner, in said State; (e) a line from La Grande, in the State of Oregon, via Elgin and Wallowa to Joseph in said State; (f) a line from Starbuck, in the State of Washington, to Pomeroy, in said State; (g) a line from Connell, in the State of Washington, to La Crosse, in said State; (h) a line from Colfax, in the State of Washington, to Moscow, in the State of Idaho; (i) a line from Bolles junction, in the State of Washington, via Dayton, to Turner, in said State; (j) a line from Winona junction, in the State of Washington, to Seltice, in said State; (k) a line from Tekoa, in the State of Washington, to Mullan, in the State of Idaho; (l) a line from Wallace, in the State of Idaho, to Burke, in said State; (m) a line from Sierra Nevada junction, in the State of Idaho, to Sierra
2839 Nevada mine, in said State; (n) a line from Fairfield, in the State of Washington, to Waverly, in said State.

2. The railroad and telegraph line of the Oregon Railroad and Navigation Company from Portland, in the State of Oregon, via St. Johns, to Troutdale, in said State, and in connection therewith a cut-off by a tunnel through the peninsula between the Columbia and Willamette Rivers, a part of said line being now constructed, and the remainder being under construction.

3. A railroad and telegraph line from Portland, in the State of Oregon, on some eligible route to be hereafter selected, to a point at or near the mouth of the Columbia River on either the north or south side of said river, no portion of which has been constructed, but which is mentioned and described in the articles of incorporation of the Oregon Railroad and Navigation Company.

4. A railroad and telegraph line from Coyote, in the State of Oregon, to Stanfield, in said State, none of which has been constructed, but which the Oregon Railroad and Navigation Company proposes to construct.

5. The railroad and telegraph line owned and now under construction by Des Chutes Railroad Company from Des Chutes station, on the line of the Oregon Railroad and Navigation Company, in the State of Oregon, to Bend, in said State, and all of the interest, estate, right, possession and use of Des Chutes Railroad Company in and to any part of the railroad and telegraph line of Oregon Trunk Railway between said Des Chutes station and Bend, in the State of Oregon.

2840 6. The constructed railroad and telegraph line now owned by Columbia Southern Railway Company extending from a point at or near Biggs station, in the State of Oregon, to Shaniko, in said State.

7. The constructed railroad and telegraph line now owned by Columbia River & Oregon Central Railroad Company, extending from Arlington, in the State of Oregon, to Condon, in said State.

8. The constructed railroad and telegraph line now owned by Umatilla Central Railroad Company, extending from a point on the line of the Oregon Railroad and Navigation Company near Pendleton, in the State of Oregon, to Pilot Rock, in said State; and the railroad and telegraph lines projected and proposed to be constructed by Umatilla Central Railroad Company, namely: (a) A line from a point at or near Pilot Rock, in the State of Oregon, on such route as may be selected by the board of directors, to a point at or near the confluence of Snake Creek and the north fork of John Day River, in the State of Oregon; (b) a line of railroad from a connection with the last-named railroad line at or near the confluence of Bear Creek and Birch Creek, in Umatilla County, Oregon, to a point on Camas Creek, at or near the confluence of Camas Creek and Hideway Creek, in said State.

9. The constructed railroad and telegraph line now owned by Snake River Valley Railroad Company, from Wallula, in the State of Washington, along the Snake River to Grange City, in said State.

2841 10. The constructed railroad and telegraph line of Oregon, Washington & Idaho Railroad Company extending from Lewiston junction, in the State of Washington, to Lewiston, in the State of Idaho, and all of the interest, estate, rights, possession, and use of Oregon, Washington & Idaho Railroad Company in and to the railroad and telegraph line owned by Northern Pacific Railway Com-

pany, extending from Lewiston, in the State of Idaho, to Joseph, in said State, including the terminal property of Northern Pacific Railway Company at Lewiston, in the State of Idaho, under and by virtue of contracts made by Oregon, Washington & Idaho Railroad Company with Northern Pacific Railway Company; and all of the interest, estate, rights, possession, and use of Oregon, Washington & Idaho Railroad Company in and to the railroad and telegraph line owned by Clearwater Short Line Railway Company extending from Joseph, in the State of Idaho, to Grangeville, in said State, under and by virtue of contracts heretofore made by Oregon, Washington & Idaho Railroad Company with said Clearwater Short Line Railway Company.

11. The constructed, partially constructed, and projected railroad and telegraph line now owned, constructed, or proposed to be constructed by Northwestern Railroad Company from a point on the line of Oregon Short Line Railroad Company, about two miles east of Huntington, Oregon, and extending along the Snake River, via Clarkston, Idaho, and crossing the Snake River to a point of connection with constructed line of Oregon, Washington & Idaho Railroad Company near Lewiston, Idaho.

2842 12. The constructed railroad and telegraph line now owned by Idaho Northern Railroad Company extending from Enaville, in the State of Idaho, to the mouth of the Paragon Gulch, about six miles east of the town of Murray, in said State.

13. The constructed railroad and telegraph line now owned by Lake Creek & Cœur d'Alene Railroad Company, extending from Lake junction, on the line of the Oregon Railroad and Navigation Company, in the State of Washington, to Lake Point, on Cœur d'Alene Lake, in the State of Idaho.

14. The constructed railroad and telegraph line now owned by Ilwaco Railroad Company, extending from Megler, in the State of Washington, via Ilwaco, to a point on the navigable waters of Shoalwater Bay at or near Nahcotta, in said State.

15. The constructed railroad and telegraph line now owned by Oregon and Washington Railroad Company from Centralia, in the State of Washington, to Hoquiam, in said State, and the constructed railroad and telegraph line now owned by Oregon and Washington Railroad Company from Wabash, in the State of Washington, to Tono, in said State, and any constructed railroad and telegraph lines now owned by Oregon and Washington Railroad Company, on any part or parts of the route between Everett, in the State of Washington, and Portland, in the State of Oregon, and the estate, interest, right, use, and possession of Oregon and Washington Railroad Company in and to any and all lines of railroad on any part of the route

2843 from Everett, in the State of Washington to Portland, in the State of Oregon, now enjoyed and possessed, or hereafter to be enjoyed or possessed by Oregon and Washington Railroad Company under contracts made by said company with Chicago, Milwaukee & Puget Sound Railway Company, with Northern Pacific Railway Company, with Northern Pacific Railway Company and Spokane,

Portland & Seattle Railway Company, or with the Oregon Railroad and Navigation Company, each of said contracts relating to parts of said line from said Everett to said Portland, including the bridge of Spokane, Portland & Seattle Railway Company across the Columbia River, near Vancouver, Washington.

16. The railroad and telegraph line projected and proposed to be constructed by Oregon and Washington Railroad Company, from a point at or near Winlock, Lewis County, in the State of Washington, to Sulphur Springs, in said State.

17. The constructed railroad and telegraph line now owned by the Malheur Valley Railway Company, extending from Ontario, Oregon, to Vale, in said State, and a railroad and telegraph line projected and proposed to be constructed by said Malheur Valley Railway Company from Vale, in the State of Oregon, to Brogan, in said State.

18. That part of the railroad and telegraph lines projected and proposed to be constructed by Oregon Eastern Railway Company, consisting of: (a) A line from Vale across the State of Oregon to a point at or near Odell, in said State; (b) a line from a point in
2844 Christmas Valley, in the State of Oregon, on said line from Vale to Odell, thence through Silver Lake Valley and through Chewaucan Valley and Goose Lake Valley to a point on the boundary line between California and Oregon, in township forty-eight (48) north, range fourteen (14) east of Mt. Diablo Meridian; (c) a line from Bend, in the State of Oregon, to Odell, in said State.

19. That part of the constructed, partially constructed, and projected railroad and telegraph lines of the North Coast Railroad Company hereinafter mentioned, to wit:

(a) A line from Attalia, a point on the line of the Snake River Valley Railroad Company in Walla Walla County, in the State of Washington, to North Yakima, in said State.

(b) A line from Sunnyside junction, a point on the last-named line in Yakima County, in the State of Washington, to Sunnyside, in said State.

(c) A line from North Prosser, in the State of Washington, to Prosser, in said State.

(d) A line from Granger, in the State of Washington, through Toppenish to a point near Fort Simcoe, in said State.

(e) A line from some point hereafter to be selected on the line from Granger to Fort Simcoe, in the State of Washington, thence northerly to Parker siding, in said State, a point on the Attalia-Yakima line south of Yakima City.

2845 (f) A line from Benton through Hanford, White Bluffs, Beverly, and Wenatchee to the mouth of Okanogan River, all in the State of Washington.

(g) A line from a point on the Attalia-North Yakima line south of Richlands, thence through Richlands to Hanford, all in the State of Washington.

(h) A line from Spokane through Cheney, Cow Creek junction, and Hooper to a connection with the line of the Snake River Valley Railroad Company near Ayer, all in the State of Washington.

(i) A line from a point on the last-named line near the crossing of the Snake River southerly to Walla Walla, all in the State of Washington.

(j) A line from Cow Creek junction, a point on the line from Spokane to Ayer, through Connell and Ringold Bar to Priest Rapids junction, between Benton and Hanford, all in the State of Washington.

(k) A line from a point on the Spokane-Ayer line south of Sprague, thence in a northwesterly direction to Davenport, all in the State of Washington.

Second: To acquire in any lawful manner and to own and operate all or any part of the railroads, steamboats, steamships, telegraph lines, and all rights, privileges, and franchises exercised in connection therewith, now owned by the Oregon Railroad and Navigation Company, the Columbia and Palouse Railroad Company,
2846 Oregon and Washington Railroad Company, Columbia River & Oregon Central Railroad Company, Columbia Southern Railway Company, Des Chutes Railroad Company, Ilwaco Railroad Company, Lake Creek & Cœur d'Alene Railroad Company, Oregon Eastern Railway Company, Oregon, Washington & Idaho Railroad Company, Spokane Union Depot Company, Snake River Valley Railroad Company, Southern Extensions Railway Company, Umatilla Central Railroad Company, Walla Walla and Columbia River Railroad Company, North Coast Railroad Company, Idaho Northern Railroad Company, Northwestern Railroad Company, Malheur Valley Railway Company, or of either or any of said companies, and all or any other property of any kind now owned by either or any of said companies; and also to acquire, own, hold, and operate the necessary stations, station facilities, side tracks, terminal facilities, and branches necessary or proper for the conduct of said properties and each of them, and to construct, complete, equip, maintain, and operate said railroads and telegraph lines and branches, steamboats and steamships, and to carry freight and passengers thereon and to receive tolls for the carriage of the same.

Third: To have, enjoy, and exercise in connection with each of said constructed, partially constructed, or projected lines of railroad and telegraph lines hereinbefore mentioned and between the termini of each of said lines all of the franchises, rights, privileges, and functions of a common carrier and of a railroad company.

2847 Fourth: To purchase or consolidate with, lease or otherwise acquire, and to operate and maintain, on such terms as may be agreed upon, any railroad or railroads in the States of Oregon, Washington, and Idaho, with its or their rolling stock, equipment, and appurtenances, and to construct and complete the same to its or their authorized terminus or termini; to assume or guarantee the payment of any bonds issued by any railroad company or companies whose property is so purchased, leased, or otherwise acquired; to sell, lease, or otherwise dispose of, or mortgage all or any part of its railroads, telegraph lines, or property of every nature whatsoever.

Fifth: To facilitate and to assist in the construction, building and extension, equipment and operation of any railroad line, steamship

or steamboat line in Oregon, Washington, or Idaho, or steamship line running from any point in the States of Oregon, Washington, or Idaho, to any other points, and connecting, or intending to connect or exchange traffic with the railroad, steamships, or steamboats of this corporation, and for such purpose to subscribe for or purchase the stock or bonds of any company owning or operating any railroad, steamships, or steamboats, and to guarantee, or otherwise secure, the payment of any such bonds or the interest thereon, by pledge or mortgage of the property of this corporation, or any part thereof, or otherwise, and to consolidate with, or to lease or contract for, the operation and maintaining of any and all of such railroads, steamships, or steamboat companies so aided.

2848 Sixth: To build, purchase, own, lease, or operate steamboats between the ports of Portland, Astoria, Seattle, Tacoma, or any points on Puget Sound, Victoria, Vancouver, San Francisco, and points in Alaska, or any other ports on the Pacific Ocean, and steamboats on the Columbia, Willamette, Snake Rivers, Cœur d'Alene Lake and Puget Sound, and Shoalwater Bay, and to build, purchase and own or lease docks, piers, locks, warehouses, ferryboats, stages, and other means of transportation in connection with the railroads, steamships, and steamboats of this company, or operated in connection with this company.

Seventh: To purchase or lease lands, whether adjacent or contiguous to its railroads, docks, warehouses, or not, and to hold, possess, improve, lease, sell, mortgage, or otherwise dispose of such lands in such manner as it may be deemed fit.

Eighth: To borrow money on bonds, notes, or otherwise, for the purposes of the corporation, and to mortgage its railroads, steamships, steamboats, franchises, rolling stock, and any and all property to secure the payment thereof.

Ninth: To do all other things necessary or proper for the accomplishment of the business above specified.

Article IV

The principal office and place of business of this company shall be Portland in the State of Oregon.

2849 Article V

The capital stock of this corporation shall be fifty million (50,000,000) dollars, and the amount of each share of such capital stock shall be one hundred (100) dollars.

Article VI

The undersigned, R. B. Miller, R. Koehler, and M. J. Buckley, or any two of them, are hereby appointed to open stock books of the corporation, to receive subscriptions, and organize the corporation.

In witness whereof, we have to these presents, executed in triplicate, set our hands and seals this 23rd day of November, A. D. 1910.

R. B. MILLER [SEAL.]
R. KOEHLER [SEAL.]
M. J. BUCKLEY [SEAL.]

STATE OF OREGON,
County of Multnomah, ss:

Be it remembered, That on this 23rd day of November, A. D. 1910, before me, the undersigned, a notary public in and for said county and State, personally appeared the within named R. B. Miller, R. Koehler, and M. J. Buckley, personally known to me, and known to me
2850 to be the identical persons described in, and who executed, the foregoing articles of incorporation of Oregon-Washington Railroad & Navigation Company, and acknowledged to me that they executed the same as their free and voluntary act and deed for the uses and purposes therein mentioned.

In witness whereof, I have hereto set my hand and seal the day and year first above written.

[SEAL.]

JOHN P. HANNON,
Notary Public for Oregon.

My term as Notary Public expires August 18th, 1912.

2851 *Defendant's Exhibit B*

State of Oregon

Corporation department

I, Mark D. McCallister, corporation commissioner and custodian of the seal of the corporation department of the State of Oregon, do hereby certify that I have carefully compared the annexed copy of supplementary articles of incorporation of Oregon-Washington Railroad & Naviagtion Company with the original now on file in my office, and that the same is a correct transcript therefrom, and of the whole thereof. I further certify that this authentication is in due form and by the proper officer.

In testimony whereof, I have hereunto set my hand and affixed hereto the seal of the corporation department of the State of Oregon.

Done at the capitol, at Salem, Oregon, this 11th day of July, 1928.

[SEAL.]

MARK D. MCCALLISTER,
Corporation commissioner.

U. S. District Court, District of Oregon. Filed Sep. 29, 1930, G. H. Marsh, clerk, by H. L. Kenyon, deputy.

2852 Supplementary Articles of Incorporation
of
Oregon-Washington Railroad & Navigation Company

Whereas, at a meeting of the stockholders of the Oregon-Washington Railroad & Navigation Company, a corporation of the State of Oregon, duly and regularly called and held at the Offices of the company in the city of Portland, Oregon, on the 2nd day of July,

1928, at which there were present and voting, either in person or by proxy, stockholders owning more than seven-eights of the capital stock of said corporation issued and outstanding, to wit: The entire capital stock issued and outstanding, there were adopted by a unanimous vote resolutions amending paragraphs 11 and 18 of section first of Article III of the articles of incorporation of said corporation in the form hereinafter set forth, for the purpose of changing certain parts of its railroad and certain termini therein described, and authorizing and directing the board of directors or a majority of the directors of said corporation to execute and file supplementary articles embodying said amendments, and

Whereas, at a special meeting of the board of directors of said corporation duly called and held at the offices of the company in the City of New York, on the 3d day of July, 1928, said board of directors duly approved and adopted these supplementary articles of incorporation and authorized and directed the same to be executed and acknowledged in behalf of said corporation by any eight directors of said board, being a majority of the directors of said corpo-
2853 ration; and further authorized and directed the officers of said corporation to file the same and publish notice thereof as required by law:

Now, therefore, we E. Roland Harriman, Charles A. Stone, Robert A. Lovett, J. H. Perkins, C. B. Seger, F. W. Charske, R. S. Lovett, C. R. Gray, constituting a majority of the directors of said Oregon-Washington Railroad & Navigation Company, and being thereto duly authorized by the aforesaid action of the stockholders and board of directors of said corporation, do hereby execute and acknowledge supplementary articles of incorporation, amending paragraphs 11 and 18 of section first of Article III of the original articles of incorporation of said corporation to read, respectively, as follows:

11. The line of railroad and telegraph constructed and formerly owned by Northwestern Railroad Company, extending from a point on the line of Oregon Short Line Railroad Company about two miles east of Huntington in the State of Oregon, thence along the west bank of the Snake River to Homestead, in said State.

18. The line of railroad and telegraph extending from Vale, in Malheur County, to Burns, in Harney County, both in the State of Oregon.

In witness whereof, we have hereunto set our hands and seals this 3d day of July, A. D., 1928.

Signed, sealed and delivered in the presence of:

HENRY W. CLARK.
EDWIN M. KINDLER.

E. ROLAND HARRIMAN. [SEAL.]
CHARLES A. STONE. [SEAL.]

F. W. CHARSKE. [SEAL.]
R. S. Lovett. [SEAL.]
C. R. GRAY. [SEAL.]

2854 STATE OF NEW YORK,
County of New York, ss:

This certifies that on this 3d day of July, A. D. 1928, before me, the undersigned, a notary public in and for the county of Kings in said State and duly authorized to take acknowledgments in said county of New York, personally appeared E. Roland Harriman, Charles A. Stone, Robert A. Lovett, J. H. Perkins, C. B. Seger, F. W. Charske, R. S. Lovett, C. R. Gray known to me to be the identical persons named in and who executed the foregoing supplementary articles of incorporation, and they severally acknowledged to me that they executed the same freely and voluntarily for the uses and purposes therein mentioned.

In testimony whereof, I have hereunto set my hand and seal, the day and year first above written.

[NOTARIAL SEAL.] FRANK E. TILLEY,
Notary Public, Kings County No. 193, cert. filed in N. Y. Co. No. 77, commission expires March 30, 1929.

Endorsed: 15366. Supplementary articles of incorporation of Oregon-Washington Railroad & Navigation Company. Filed in the office of the corporation commissioner of the State of Oregon at 8.30 o'clock a. m., the 11th day of July, 1928.

MARK D. MCCALLISTER,
Corporation Commissioner.

2855 Endorsed: Instrument Number 79724. Supplementary articles of incorporation of Oregon-Washington Railroad & Navigation Company. Filed at the request of A. C. Spencer, July 20th, 1928, at 1.30 o'clock, p. m., records of Shoshone County, State of Idaho. Harry A. Rogers, county recorder.

STATE OF IDAHO,
County of Shoshone, ss:

I, Harry A. Rogers, county recorder in and for the county of Shoshone, State of Idaho, do hereby certify that I have carefully compared the foregoing copy of the supplementary articles of incorporation of the Oregon-Washington Railroad & Navigation Company, with a certified copy thereof, and that the same is a full, true, and correct transcript therefrom, together with all official endorsements thereon, as the same appears on file and of record, at my office and in my custody.

In witness whereof, I hereunto set my hand and affix my official seal at my office in Wallace, Idaho, this 20th day of July, A. D. 1928.

[SEAL.] (Sgd.) HARRY A. ROGERS,
County Recorder.

2856 *Defendant's Exhibit C*

Extension Crane to Burns, Oregon

U. S. District Court, District of Oregon. Filed Sep. 29, 1930, G. H. Marsh, clerk, by H. S. Kenyon, deputy.

On motion, duly made and seconded, the following preamble and resolutions were unanimously adopted:

Whereas, this company, Oregon-Washington Railroad & Navigation Company, owns and operates a line of railway and telegraph from Ontario to Crane, both in the State of Oregon, and desires to construct, acquire, maintain, and operate a branch line or extension of said existing line of railway, as hereinafter defined and described, and to exercise therefor the right of eminent domain as provided by the laws of the State of Oregon:

Resolved, That this company construct, acquire, maintain, and operate a branch line or extension of its existing line of railway aforesaid from a connection with said existing line of railway at or near its present terminus at Crane, in Harney County, Oregon, thence running in a northwesterly direction to a terminus at or near Burns, in Harney County, Oregon, a distance of approximately 32 miles; and said branch line of railway or extension defined and described as aforesaid is hereby adopted by this company as a branch and extension of its existing line of railway aforesaid; and

Resolved, That copies of these resolutions, certified by the secretary of this company, under its corporate seal, be filed as required by the laws of the State of Oregon, and that the officers of
2857 this company are hereby authorized and directed to do any and all other acts necessary or appropriate for the purpose of complying with or obtaining the benefits of an act of the legislature of Oregon, entitled "An act to provide for the method of building of branch and side lines or extensions of railway companies," approved February 27, 1901.

I, Thomas Price, secretary of Oregon-Washington Railroad & Navigation Company, do hereby certify that the above and foregoing is a true copy of resolutions duly adopted by the board of directors of Oregon-Washington Railroad & Navigation Company, at a regular metting of said board of directors held at the principal office of the company in the City and State of New York on the 8th day of November, 1923, at which a quorum was present.

In witness whereof, I have hereunto subscribed my name and affixed the seal of said company this 8th day of November, 1923.

[SEAL.] THOMAS PRICE,
Secretary.

2860 Before the Interstate Commerce Commission

Docket No. 19680

PUBLIC SERVICE COMMISSION OF OREGON, COMPLAINANT *vs.* CENTRAL Pacific Railway Company, et al., defendants

Reply of Public Service Commission of Oregon, complainant, and of Public Utilities Commission of Idaho, Grants Pass Chamber of Commerce, Ontario Commercial Club, Douglas County, Oregon, Roseburg, Oregon, Chamber of Commerce, Coos County Chamber of Commerce, Portland Chamber of Commerce of Portland, Oregon, Lane County Court, Springfield Chamber of Commerce, Eugene Chamber of Commerce, Portland Traffic & Transportation Association, Grant County, Oregon, Burns Chamber fo Commerce, Harney County, Oregon, Albany Chamber of Commerce, County Court of Malheur County, Oregon, Willamette Valley Lumbermen's Association and Salem, Oregon, Chamber of Commerce, Interveners to exceptions of defendant carriers

The argument presented by defendant carriers in support of their exceptions herein is, as counsel for carriers state, largely a repetition of the argument contained in their opening briefs, the contents of which was covered by the opening brief filed on behalf of this complainant and the interveners in its behalf. There are, however, a few additions thereto to which we briefly reply.

2861 Objections advanced by Central Pacific and Southern Pacific Companies

Despite the fact that the proposed report herein makes no requiremen of either of these companies, and requires no expenditure on their part they have filed herein voluminous exceptions and argument concerning nearly every phase of the report. While their right to do so

can not be questioned it does seem that in presenting these arguments counsel for these companies have been unusually solicitous of the welfare of Union Pacific lines, upon whom the burden of the suggested investment would, by the terms of the report, fall. However, we will treat briefly of each of the major contentions which they advance.

First among these may be mentioned the legal questions raised with reference to paragraph 21 of section 1 of the act under which this proceeding is primarily presented. These legal questions are presented under three general subdivisions, the first dealing with the constitutionality of the provisions upon which we rely, the second dealing with the wisdom of Congress in enacting such a requirement and the third dealing with the interpretation thereof. The first two matters we will pass without discussion for the obvious reason that it is beyond the scope of the duties of this commission to question either the constitutionality or wisdom of the acts of Congress.
2862 We shall assume for the purpose of this argument that this commission will accept and apply the mandate of Congress as it finds it.

Construction of paragraph 21 of section 1 of the act

It is suggested by counsel that the difficulty with the provisions of subdivision 21 of section 1 may lie in our interpretation of it rather than in the provision itself and to this question we would direct particular attention. Counsel says that the true construction of paragraph 21 is that it provides a procedure for enforcing obligations declared elsewhere in the act or which existed upon carriers by railroad by the common law and that it does not attempt to impose a requirement of construction to new territories. In determining the intent of Congress with reference to this paragraph consideration must be given not to this paragraph alone but to the transportation act as a whole. We must bear in mind first of all the essential intent of Congress in promulgating the transportation act of 1920 and its fundamental purposes concerning our national transportation system.

This act has been before the courts on numerous occasions and there can be no serious doubt as to the essential purpose Congress had in mind. This purpose is probably best expressed by the
2863 United States Supreme Court in the case of Akron, C. & Y. R. R. Co. et al. v. U. S., 43 Supreme Court Reports 270, at page 273, wherein Justice Brandeis speaking for the court said:

"Transportation act 1920, introduced into the Federal legislation a new railroad policy. Railroad Commission of Wisconsin v. Chicago, B. & Q. R. R. Co., 257 U. S. 563, 585, 42 Sup. Ct. 232, 66 L. Ed. 371. Theretofore, the effort of Congress had been directed mainly to the prevention of abuses, particularly those arising from excessive or discriminatory rates. The 1920 act sought to insure, also, adequate transportation service. That such was its purpose Congress did not leave to inference. The new purpose was expressed in unequivocal language. And, to attain it, new rights, new obligations, new machinery, were created."

Among the many provisions of the act designed to foster this clear purpose may be mentioned the recapture clause, the provisions of section 15-A with reference to earnings to be allowed to the carriers, the provisions with reference to division of earnings and the assistance of the weaker lines, the provisions with reference to consolidation of lines, the requirements of subdivision 18 of section 1 providing for certificates of public convenience and necessity for the construction or extension of lines, and the provision under which this proceeding is brought. It should be noted here all of these new features of the act tend to serve the single purpose of providing an adequate
2864 system of transportation for the entire Nation. Most of these requirements result in enlargement upon the rights of the carriers and extend to them protection not theretofore accorded. The old theory advocated by counsel for the carriers in this case, that railroads are built and operated for the sole benefit of stockholders, is supplemented by a newer and more desirable theory which is in effect that they shall be operated to serve the Nation and that so long as they do so they shall be accorded every reasonable protection within the power of Congress.

Most of these several provisions mentioned have been before the judicial tribunals for review and have been approved. It is significant, however, that where these provisions have been beneficial to the carriers they have been accepted by them without question but whenever the public asks something in return and attempts to apply the sections of the law designed for public benefit the act is immediately attacked as unconstitutional and unfair.

Directing particular attention to the convenience and necessity provisions of the interstate commerce act we find that its essential requirements are embraced within paragraphs 18 and 21 of section 1. The first of these provisions provides protection to the carriers against unwarranted invasion of territory occupied and served by them in that it prohibits the construction or operation of an additional or extended line of railroad until there shall first have been obtained from
2865 the commission a certificate that the present or future public convenience and necessity requires or will require such construction or operation. As a necessary and interrelated part of this convenience and necessity provision, and by way of compensation and protection to the public in return for this unusual protection which is afforded to the carriers, Congress has in subdivision 21 of this section provided that: "The commission may after a hearing * * * require any railroad * * * to extend its line or lines."

No convenience and necessity law of which we are aware lacks either of the provisions above referred to. It is certain that the uniform requirement of public convenience and necessity acts with reference to public utility properties throughout the entire country embraces both provisions above mentioned; one for the protection of the utility, the other for the protection of the public. Certainly, no public convenience and necessity act would be complete, nor would it be

equitable in its operation without both provisions. It would be farcical to suggest that the two provisions were not interrelated or that they were not of equal scope.

Yet counsel for carriers in a strained effort to give to paragraph 21 a meaning which would nullify its effect, boldly assert that it refers only to the dealings of the carrier in respect to car supply. They suggest that it authorizes the commission only to require the construc-
2866 tion of spur, industrial switching, and sidetracks. We need look no further than to the act itself to show the absurdity of this claim. Paragraph 22 states specifically that neither paragraphs 18 nor 21 are intended to apply to this class of construction. We quote this in full:

"The authority of the commission conferred by paragraphs (18) to (21), both inclusive, shall not extend to the construction or abandonment of spur, industrial, team, switching or sidetracks, located or to be located wholly within one State, or of street, suburban, or interurban electric railways, which are not operated as a part or parts of a general steam railroad system of transportation."

While it is true the above paragraph refers to such tracks located wholly within one State, it would be unusual, indeed, to find tracks of the character above described located partly in one State and partly in another, and our attention has not been directed to any instance where the jurisdiction of the commission has been exercised over such incidental trackage.

In addition to the degree of clarity which the act itself contains as to its purport and purpose the courts have given us a very clear interpretation thereof. Attention is directed to the case of Detroit & M. R. Co. v. Boyne City, G. & A. R. Co. et al., 286 Fed. 540, at page 545, wherein it is stated:

"It is a cardinal principle of statutory construction that in interpreting the language of a statute the meaning of the words used must, if not so plainly expressed as to leave no room for doubt,
2867 be determined by a consideration not only of such words but also of the purpose with which they were used by the legislative body enacting such statute, and, consequently, of the object thereby sought to be accomplished.

"It is certain that the purpose actuating Congress in adding to the Interstate Commerce Act the provision here involved was, as was pointed out by Interstate Commerce Commissioner Clark while speaking before the Committee on Interstate and Foreign Commerce of the House of Representatives, when such committee was considering the enactment of these amendatory provisions, and shortly before such enactment 'to prevent the building of duplicate lines of railroad because of keen rivalry of certain financial interests, or when the railroads so built will not serve the present or future convenience and necessity, and will simply depend for traffic upon that which they can get away from railroads already built, adding to the total burden of maintenance, capital returns, etc., which the public must pay.'

"Congress had in mind and was endeavoring to correct the disastrous evils, to both the railroads and the public, which for many years had attended the construction of lines of railroad, main and branch, in ruinous competition with each other and with resultant injury to the public, which was compelled to bear the inevitable consequences of such a situation. The statutory provisions now under consideration substituted, as the underlying basis for the construction of new lines of railroad (main and branch), in place of the previously controlling policy of the private desires and am-
2868 bitions of owners of railroads, the new test and rule of public convenience and necessity. The specific mischief, however, which, in this particular instance, it was sought to guard against was the construction of such new lines of railroads, not the construction of merely incidental tracks such as those excepted by paragraph 22 of section 1, from the provisions of the statute. In view of the relatively small expense of these last-mentioned tracks and the inherent improbability of such construction unless actually needed in connection with main or branch lines, it was evidently deemed by Congress unnecessary, if not unwise, to require a public hearing, with the consequently procedural formality and conditions necessarily incident thereto, whenever it should be desired to lay one of these auxiliary tracks so commonly used and needed through the country."

In view of the foregoing significant facts, the express language used by Congress, and the clear interpretation of the courts there can be no question as to the power which Congress sought to and did vest in this commission with respect to requiring the construction of extensions of existing railroad lines.

Public necessity and convenience

Counsel for Southern Pacific and Central Pacific Companies contend there is no showing of public necessity and convenience in this record sufficient to justify an order by the commission requiring the proposed construction. In advancing this contention counsel imply that the public convenience and necessity which would
2869 authorize an order requiring construction is somewhat different than the public convenience and necessity which would authorize or justify the granting of a permissive order upon the application of an interested carrier. To suggest a distinction in the two requirements is to imply that Congress intended to grant more privileges to the carriers than it did protection to the public, a suggestion wholly unwarranted. We have hereinbefore indicated why these two sections must be construed together and given equal force and effect, but for a more complete discussion of the question we would refer to our opening brief herein where the subject is discussed at considerable length.

The principal argument advanced by counsel in an effort to controvert our claim of public convenience and necessity for the proposed line is to the effect that the Southern Pacific system is engaged in

constructing the Modoc Northern line which will provide a somewhat shorter route between western Oregon and Ogden, Utah, and points east thereof than now exist by way of Roseville, California. The plans of Southern Pacific officials with respect to this line are discussed in great detail and counsel conclude with the suggestion that by reason of this proposed construction there is no need for the cross-State line.

In answering this contention it should be sufficient to point out that our claim and plea throughout this entire proceeding has
2870 been for an east and west line through the center of the State of Oregon. The Southern Pacific Company offers us instead a north and south line which is to be constructed almost entirely within the States of California and Nevada. We are asking for a railroad to serve the States of Oregon and the southwestern section of Idaho; the Southern Pacific Company offers us instead a line destined primarily to develop a now unserved area in northern California and to provide an additional route extending north and south between Oregon and California. We have asked for a line which will shorten the distance between western Oregon and points east by approximately 426 miles over the existing route by way of Roseville, California; Southern Pacific Company offers us a route which shortens the distance only approximately half that amount.

While we freely admit that the Modoc Northern will afford some measure of relief to the shippers of western Oregon, it is only a partial relief, and does not fully meet the requirements of public convenience and necessity of western Oregon shippers alone. But assuming for the purpose of argument that the Modoc Northern were adequate and satisfactory to meet the needs of western Oregon, Southern Pacific Company has fulfilled only a single need out of many shown. It has certainly not answered the insistent demand of southwestern Idaho for a direct outlet to the Pacific coast markets; it has
2871 certainly not answered the insistent demand of Malheur County, Oregon, a county of more than 6,000,000 acres, for an outlet to the markets of the coast; it has not answered the demands and necessities of Harney County, Oregon, a county nearly as large as the State of Maryland and larger than the States of Massachusetts and Rhode Island combined, for an opportunity to sell its products in other portions of the State of Oregon and to have market outlets for the many products it can successfully produce; it does not meet the transportation needs of northern Lake County, Oregon, a county with an area of 7,834 square miles, with vast stands of timber, substantial mineral resources, and unlimited agricultural possibilities, yet with less than 14 miles of railroad within its borders. Nor have they answered the need for direct routes for the movement of freight from San Francisco, from Coos Bay and other coast ports to the interior of Oregon and southwestern Idaho, nor of the owners of soda deposits at Alkali Lake that they be permitted to market their products. Nor does the proposal of Southern Pacific Company afford any hope whatever of competitive railroad transportation service in the vast area of Oregon west of the Cascades. In short,

it offers to satisfy a minor and incidental part of our complaint in a minor degree only, but offers nothing as to the more dire transportation necessities confronting the territory affected by our complaint.

2872 Diversion of Traffic

Southern Pacific company next takes serious exception to testimony and exhibits contained in this record by which complainants have claimed for the cross-State line revenue accruing on traffic originating in western Oregon and now routed via Ogden, Utah; likewise to savings in operating cost which will accrue through the routing of traffic via the cross-State line. As a foundation for their argument against the use of this data carriers call attention to the fact that certain witnesses for complainant either directly or impliedly admitted the proposed cross-State line would not be profitable at the outset without such diverted traffic from western Oregon. After attempting to show that this western Oregon traffic could not lawfully be diverted and, therefore, that the saving which we claim would not result, carriers conclude that our proposed construction can not be justified.

Before entering into a discussion of the diversion of this western Oregon traffic, and the propriety of our estimates based thereon, we would point out that the conclusion reached by carriers is entirely fallacious for the reason that it assumes that to show public convenience and necessity we must at the same time show that the line would be profitable to the carriers if constructed. We do not so construe the provisions of law under which our complaint is prosecuted.

2873 Neither this commission nor the courts have ever held that every branch or segment of the transportation system of any carrier must be a profitable investment when considered separate and apart from the balance of the system. Certainly a greater guarantee of profitableness can not be required of a new line during its development period. We urge, therefore, that we are not required by any provision of law nor by any policy of this commission or of the courts to prove that an immediate profit will ensue from the construction and operation of the proposed line. It is our thought in this matter that evidence of revenue and expenses is important as an incident only to our proof of public convenience and necessity and to our proof that the construction will not impair the ability of the carriers to serve the public.

What counsel say with respect to the power of the commission to order joint rates and through routes via the proposed new line is likewise of little significance, for when we have met the two essential requirements of the act above referred to our case is complete.

As we have pointed out in our opening brief, the cross-State line is not dependent for its traffic or revenue upon whether or not it is able to obtain diverted traffic from the existing lines of Southern Pacific company in western Oregon through means of joint rates or

2874 joint traffic arrangements. These are only some of the methods by which the line may be supported. If the carriers do not choose to follow them, there are yet others available, including the

common user of trackage, the extension of branches into virgin territory now unserved and yet offering vast tonnage possibilities. All of these things have been clearly shown in the evidence of the complainant and interveners in its behalf and we are positive we have met the full requirements of the law. If the carriers, through motives of their own, refuse to avail themselves of these possibilities, and the cross-State line should thus prove unprofitable this is a failure chargeable only to themselves. The old adage is to the effect that you may lead a horse to water but you can not make him drink, and this in effect is the suggestion which carriers make. We have fulfilled our part when we provide the tonnage and lead them to it.

Unreasonable Circuity of Haul

Counsel for carriers question the right of the commission to require diversion of western Oregon traffic to the cross-State line by the establishment of through routes and joint rates. While we contend that this question is not of serious importance, for reasons hereinbefore pointed out, we desire to emphasize the fact that power is vested in the commission to require the diversion of western Oregon traffic now delivered to the Union Pacific system at Ogden, Utah.

2875 This commission is empowered by the provisions of paragraph 3 of section 15 of the interstate commerce act, whenever it is deemed necessary or desirable in the public interest, to establish through routes and joint rates for the transportation of passengers and property. The provisions of this section have been frequently applied. To quote from the language of the commission in Blakely Southern. Rd. Co. v. Atlantic C. L. Rd. Co., 26 I. C. C. 344, 348:

"The establishment of joint through rates, generally speaking, tends to expand markets and facilitate trade. They have been required as the result of the numerous decisions of this commission, since the act to regulate commerce was amended authorizing this commission to exercise that power. The amendment in itself declares a public policy established by Congress, which it is the duty of the commission to protect and perpetuate."

In the case of Chicago, Milwaukee & St. Paul Railroad Co. v. U. P. Railroad Co. et al., 88 I. C. C. 312, this commission, in requiring the establishment of an additional through route, used the following significant language, which we believe applicable to the present proceeding:

"It is desirable in the public interest, that the efficiency and availability of all the transcontinental lines be conserved and enlarged, rather than restricted. * * * There can be no doubt that the needs of the public, more especially in the future development of the northwest, would be more adequately met by the establishment of the additional route."

2876 While, under a through route and joint rate, the original carrier is ordinarily entitled to the long haul, this is not true where the inclusion of the originating carrier's lines "would make the

through route unreasonably long, as compared with another practicable through route which could otherwise be established." (Paragraph 4, section 15, interstate commerce act.)

The situation here presented to the commission is certainly one where a through route and joint rate from western Oregon via Crescent and the Union Pacific system, would be justified and within the province of the commission to require, for as Professor Ripley, in discussing the western Oregon traffic, has said:

"The natural flow of the traffic, it is alleged, is down hill to the north from the California boundary and hence out to the east by the Oregon Short Line * * *,"

which is exactly the proposition substantiated by the record herein.

As was said by this commission in the case of Freight Bureau of Little Rock v. M. V. R. R. Co. et al., 13 I. C. C. 243, 245:

"It is the duty of a railroad to carry goods offered to it for shipment but it is not its province to determine to what points these goods shall be carried."

However, the practical monopoly enjoyed by the Southern
2877 Pacific Company in western Oregon has, to all intents and purposes, permitted it to determine the destination of western Oregon freight and in this way say with whom western Oregon may trade and where they may sell their produce.

The authority of this commission to establish through routes and joint rates, notwithstanding the necessity of depriving the carrier of its long haul on traffic, has been upheld by the courts. See St. Louis, S. W. Railway v. U. S., 234 Federal 668.

Further provisions are contained in the act for the purpose of assuring an adequate transportation service, many of which would be of assistance in assuring a trans-State line of tonnage from and to western Oregon. Particular attention is called to paragraph 16 of section 1 of the act:

"(16) Whenever the commission is of the opinion that any carrier by railroad subject to this act is for any reason unable to transport the traffic offered it so as properly to serve the public, it may, upon the same procedure as provided in paragraph (15), make such just and reasonable directions with respect to the handling, routing, and movement of the traffic of such carrier and its distribution over other lines of roads, as in the opinion of the commission will best promote the service in the interest of the public and the commerce of the people, and upon such terms as between the carriers as they may agree
2878 upon, or, in the event of their disagreement, as the commission may, after subsequent hearing, find to be just and reasonable."

Aside from the legal aspect of the diversion plan suggested by some of our witnesses as assuring a reasonable earning to the cross-State line immediately upon its construction, carriers suggest that such a plan would result in injustice to the Southern Pacific Company, the originating carrier. But this suggestion of injustice overlooks entirely the basis upon which this diversion is suggested. Were we

suggesting that the commission require the diversion and limit the earnings on the original haul to the diversion point at Crescent, thus requiring the originating line to be content with a lesser earning that it now derives from its haul to Ogden there might be some ground for complaint. However, such is not the suggestion of this complainant. On the contrary we have proposed a far more equitable arrangement for the Southern Pacific Company than the one under which it now operates in that we propose to give it as great an earning for the shorter haul to Crescent as it now derives for the longer haul to Ogden. In other words, we propose that it be allowed the full net earning which it now enjoys for a service much less expensive. Certainly there is no injustice in this. It is, in fact, difficult to understand why Southern Pacific officials do not gladly welcome such a plan to reduce their operating expenses without decreasing earn-
2879 ings. We are confident its adoption would result in as great a benefit to the stockholders of the Southern Pacific system as will result to the public through expedited service.

In discussing the extent of the circuity of existing routes carrier counsel ignore entirely the fact that the traffic now actually moves via Roseville, California, approximately 426 miles longer than via the proposed route, they assume that the Modoc Northern is constructed and in operation and, therefore, that the circuity is 213 miles instead of 426 miles. They also consider in their argument only the percentage of circuity on long hauls and point out on a haul to Omaha the percentage of circuity is only 11.8 per cent, implying that on shipments of lumber such a percentage of circuity would not be reasonable.

With this contention we cannot agree. While it is true testimony of certain lumber witnesses called by the carriers would indicate that a difference of 213 miles would not be of great importance, the preponderance of testimony in this record is to the effect that during recent years it has been the practice of lumber dealers in the Middle West and East to discontinue the carrying of large stocks and to depend more and more upon prompt delivery from the mills. We believe, therefore, that the preponderance of the testimony in this record will support our claim that a difference of more than 200 miles in
2880 length of haul is now an important factor even in the shipment of lumber, especially during the existing period of heavy production, and keen competition between the lumber producers of the various sections of the Northwest.

But it must be admitted that the effect of this unreasonable circuity is most severe in connection with shipments of perishables. The record discloses that western Oregon is by reason of climate and other natural advantages particularly adapted to the production of fresh fruits and vegetables similar to many of those now produced in the neighboring State of California. It will be immediately recognized that the principal markets for these products are in the more populous districts of the middle west and east where competition between producing districts is extemely keen. A difference of one or two days in time of delivery has a material effect upon the quality of the product

and means a difference between success and failure in any producing district distant from market.

The testimony given by witness Butner concerning the broccoli industry of Douglas County is merely typical of other fresh fruit and vegetable industries of western Oregon. Whether this industry survives in competition with California producers depends upon whether it is to be afforded an expeditious route for shipment com-

parable with that afforded its competitors. It is not merely a
2881 matter of convenience, but it is an absolute necessity. Certainly, a difference of 213 miles in length of haul constitutes unreasonable circuity and development of one of the principal industries of the territory affected.

But this difference of 213 miles on many long hauls does not fully reflect the extent of circuity to which our shippers are now subjected. The extent to which existing routes are circuitous may be better understood by reference to the map attached to and made a part of Exhibit No. 16. Considering the hauls between eastern and western Oregon, which are of great importance in connection with the proposed line we find that the distance between Eugene and Crane via Ontario and Portland via existing routes is 681 miles. The proposed line will reduce this distance to 285 miles resulting in a saving of 396 miles between two important districts of the State of Oregon. In passenger train movement this would doubtless represent a saving of approximately 20 hours. The percentage of circuity is approximately 138 per cent. Surely it can not be argued that this is not undue circuity.

Taking as another example the distance between Medford and Ontario, which is now 759 miles, we find that the proposed line will reduce the mileage to 570 thus saving in distance 189 miles. The distance from Klamath Falls to Huntington would be reduced from 709 to 429 miles, a saving of 282 miles. The haul on broccoli from

Roseburg to Granger would be shortened under the proposed
2882 line by 307 miles on a total haul of 1,289 miles. Especially when considering the transportation of perishable products it certainly can not be seriously contended that the existing haul is not unduly circuitous.

Shippers' right to route traffic

The right of shippers to route their traffic cannot be seriously questioned. This right is freely conceded by carriers. The only question which they raise in this regard is the extent to which shippers would avail themselves of this privilege. Southern Pacific counsel take occasion to call attention to the fact that complainants have not called a large number of shipping witnesses to testify that they would route their traffic via the cross-State line. We are confident that sufficient testimony has been produced in this record to show that with a saving of more than 200 miles in distance all of the perishable traffic and a substantial portion of nonperishable traffic would be routed by the shippers themselves via the cross-State line. Shippers of perishable products were very emphatic in their statements that this

would be their practice. This is also the testimony of Witness Magladry on behalf of the Willamette Valley Lumbermen's Association.

Carriers would infer that witness Magladry was speaking only for himself but this contention is certainly not confirmed by the record.

For the sake of brevity and to avoid calling a large number of
2883 witnesses to speak for the lumber industry, Witness Magladry was selected to appear as their spokesman and to speak the voice of the majority of the members of the Willamette Valley Lumbermen's Association. The fact that Southern Pacific Company called as witnesses two or three of its dissenting members certainly does not weaken the force of the desire of the majority whom Witness Magladry represented.

Furthermore, in considering the testimony of this character and the manner in which it has been presented we suggest that the commission take into consideration the fact that all of these western Oregon shippers are solely dependent upon the Southern Pacific Company for their car supply and service. With reference to this question of routing of lumber traffic Witness Magladry, speaking for 32 members of the Willamette Valley Lumbermen's Association, representing the principal lumber manufacturers of western Oregon, testified as follows:

"Q. (By Mr. McCULLOCH.) Mr. Magladry, has this proceeding for the construction of this cross-State line been the subject of discussion among the members of the Willamette Valley Lumbermen's Association?

A. Yes, sir; very much so.

"Q. Has the question of routing of their traffic over the proposed cross-State line, if built, been the subject of discussion among the members?

A. It has, and that was the reason that they favored the line, because of the shortening of the time and of the distance.

2884 "Q. What can you say as to the routing that would be employed by the other members of the Willamette Valley Lumbermen's Association and your own company, on eastern shipments, in the event this cross-State line is built, if you know, from the discussions that have been had and the talks that you have had with other members?

"A. Well, inasmuch as the shortening of the delivery time is the vital question, and from discussions in the association and manufacturers I have talked to outside, I would say that practically all of the shipments would be routed over this cross-State line, if it were built. (Tr., p. 2431-32.)

* * * * * * *

"Q. (By Mr. McCULLOCH.) Mr. Magladry, in your judgment would opportunity to make quicker delivery of a car of lumber from the Willamette Valley, and to use the shortest possible route to get it to an eastern destination, be as important to a lumber broker as to a lumber manufacturer?

"A. Why, sure.

"Q. In your judgment would a lumber broker, in specifying or requesting a manufacturer to specify routing of a car of lumber to an eastern destination, overlook an opportunity to use a route that would save him in distance and in time of delivery three days as compared with another route that the car might move?

"A. He would not, the rates being equal." (Tr., p. 2470–71.)

We might also suggest that similar contentions with respect to shipper routing of traffic were advanced by the Southern Pacific Company in the Klamath Basin cases, where much testimony was
2885 introduced by shipper witnesses to the effect that they would continue to ship by Southern Pacific lines exclusively even though a competing carrier might be admitted into their community. It is remarkable to note the extent to which their operations have been changed since Great Northern service has been made available to them, and the extent to which their shipments are actually being routed via the Northern lines.

That the matter of time in transit is important to the lumber manufacturers of western Oregon is also clearly indicated by the testimony of witness Cornwall, called on behalf of the carriers as an expert on the lumber industry of western Oregon, from which we quote:

"Q. Do you know whether the time in transit is an important factor in enabling the mills of the Pacific coast to compete with other producing sections in those markets of the Middle West and East that buy in small quantities for immediate use.

"A. It is a factor, yes." (Tr., p. 2797.)

That the lumber producers of Oregon would use the shortest route available is likewise indicated by the testimony of witness Cornwall appearing at page 2810 of this record.

"Q. If you were manufacturing fir lumber at an interior point where you could not ship by water, do you believe, with the information and knowledge you have now, that you would use the shortest rail route to get your products to market, and the route over which you could get the quickest time in transit?

"A. It would be preferable, yes."

2886 Irrigation districts

Carriers called as a witness in their behalf, to show certain difficulties being encountered by some of the early irrigation projects of our State, Mr. Rhea Luper, State engineer. By this testimony carriers seek to imply that irrigated farming in the State of Oregon is essentially impractical and unprofitable, therefore, that further development along this line is not to be expected. Such is not the effect of the testimony given. The witness was asked concerning only the outstanding failures among our irrigation districts and did not testify at all concerning the Owyhee, the Vale, and other major irrigation projects now in successful operation or under construction; but even as to these projects concerning which witness Luper testified, it is clear that the difficulty was not one which resulted from an inherent condition of the soil, climate, or water supply but was entirely one

of poor finance. It is also evident from this testimony that this financial difficulty is being rapidly adjusted and the poorest of these districts will soon be in successful operation again. This is indicated by the following excerpt from the testimony of Mr. Luper:

Examiner ROGERS: "Mr. Luper, I want to get the right impression about this. I know some of our railroads sometimes get in a difficult financial condition due to the way their finances are handled; some of them get in financial conditions that are difficult because there
2887 was not anything there to start with where the railroad was built. Now what is the situation of these irrigation projects? Is their financial condition due to the way they were financed or because the projects themselves were improper to start with, that there was not anything there to justify an irrigation project?

"A. Well, as a general rule, the difficulty is almost entirely due to financing, too much debt, low estimates to begin with. * * *.

"Examiner ROGERS: What do you expect out of these projects if the bondholders do reach a settlement?

"A. I expect them all to continue operating, and they will be of course much more successful and productive. * * *.

"Q. (By Mr. MCCULLOCH.) Mr. Luper, if reasonable rearrangements with the bondholders of the securities of these various districts can be effected, in your judgment can settlement of farmers thereon and the development of the latent resources of those districts be successfully carried on?

"A. Yes; I think so." (Tr., pp. 2754–2756.)

Lumber traffic

Much attention is given in the brief of Southern Pacific Company to the matter of lumber traffic, in an effort to show that no substantial increase in the volume of this traffic is to be expected in the near future. Particular weight is attached to a statement by Colonel Greeley, formerly of the United States Forestry Service and now secretary-manager of the West Coast Lumbermen's Association. In the early proceeding herein there was in evidence a statement of
2888 Colonel Greeley clearly expressing his opinion as to the future development of Oregon's timber resources and the need for additional railroad construction. To properly understand the amended statement now placed in this record the commission should have before it for consideration the essential parts of the original statement from which we quote:

"I wish to say that the enlargement of the facilities for shipping Oregon timber, by rail or by water, to the central and eastern lumber markets of the United States is a matter of very great necessity.

"During the last twenty-five years the main source of softwood lumber for general construction, house building, and industrial uses in the greater part of the Mississippi Valley and the States to the east of it has been the southern pine belt in the South Atlantic and Gulf regions. The production of lumber in these regions passed its peak about 1916 and is now gradually decreasing from exhaustion of

standing timber. A survey made by the Forest Service in cooperation with lumber manufacturers in 1920, covering 5,400 sawmills in the southern pine region, showed that over 97 per cent of them will cut out their timber by 1930, with a reduction in the output of this group of mills aggregating 78 per cent. Every year that now passes witnesses the dismantling of a considerable number of these mills, and much of the capital hitherto employed in lumber manufacture in the South is now seeking new locations on the Pacific coast. An experienced lumber manufacturer of the South, after exhaustive study of the situation, made the estimate in 1920 that by 1930, if the
2889 consumption of lumber in the Eastern States does not materially decrease, it will be necessary to increase eastbound lumber shipments from the west coast to eastern markets to the extent of 11 billion board feet per year. This contemplates simply replacing the market requirements hitherto supplied from the pine forests of the South.

"The only large supply of softwood timber now remaining in the United States is on the Pacific coast, including Alaska, and in the Columbia River Basin. The lumber manufacturing industry is now moving rapidly into this region, just as thirty years ago it moved from the region of the Great Lakes into the South. The demands for western lumber to supply eastern and central markets will, in my judgment, at least double within the next ten years. With the most rapid development of transportation facilities that can be expected, I anticipate that there will still be a serious congestion of eastbound lumber shipments from this region, more or less chronic, which will affect adversely the interests of the lumber consumers of all classes in the Eastern States. As a broad question of public policy, I believe very strongly that every reasonable effort should be exerted to increase transportation facilities from the principal timber regions of the West to eastern markets. This of course includes water transportation as well as rail transportation.

"The State of Oregon contains an estimated stand of 494 billion feet of timber, or over 20 per cent of all the timber in the United States. Oregon ranks first among all the States in timber resources. In from ten to fifteen years Oregon is bound to become the
2890 leading State of the Union in lumber production. Its present rail facilities are in my judgment wholly inadequate to the production of forest products which the resources of this State ought to support. I regard it as particularly important to see the resources of Oregon for water shipments of lumber to the Atlantic coast increase and also to see additional outlets provided to the Willamette Valley and the pine regions of central Oregon for eastbound lumber shipments. The national forests of Oregon contain about 131 billion feet of standing timber. Our present yearly cut from these Government properties is 137 million feet of timber. The yearly cut from the national forests of Oregon could properly be increased to ten or twelve times the present amount, while still insuring the unimpaired perpetuation of the resource and utilizing only its current annual

growth. It would be desirable from every standpoint to bring the cut from the national forests up to that amount, to utilize old virgin timber that is now deteriorating from decay to increase public revenue for the Nation and State, and to afford an additional supply of forest products for the markets of the country. The possibility of increasing the cut from the national forests depends to a considerable degree upon the enlargement of rail facilities. To this extent, the Government has a direct interest in the matter. The predominant consideration however, in my judgment, should be the fact that the dependence of the entire country for softwood timber is rapidly shifting to the west coast, and that its existing rail facilities are inadequate to meet this growing demand."

Since the statement was made Colonel Greeley has been
2891 employed by the West Coast Lumbermen's Association, embracing lumber manfacturers throughout the Northwest, but whose interests are predominately in the fir-producing area, the greater portion of them being within the State of Washington. The amended statement changes the former one only to a limited degree in that it indicates that the demand for Oregon lumber has not come as soon as expected, for reasons which he has stated. He does not say this demand will not come within the near future. He merely calls attention to the immediate situation confronting the lumber industry and suggests that it is in the interest of existing lumber manufacturers to curtail new development.

This is a conclusion which can not be questioned. Restriction of output in any industry raises the market price of the product and benefits those engaged in it. Less competition means better prices and more profit. However, it would seem that there are others to be considered than the existing lumber manufacturers. There are vast sections of Oregon where timber is deteriorating as fast as new growth is being produced, where timber has long been mature and ready for harvest, where forest fires and the timber beetle is a constant menace; where taxation sometimes becomes unbearable. To the owners of such timber, rail outlets to market are an absolute necessity despite the more selfish interests of existing manufacturers of lumber.

2892 This is clearly shown by thetestimony of witness Cornwall called on behalf of the carriers, from which we quote:

"In your opinion will the interests of these States or of the United States, or of individuals as owners of timberlands in these States, be served to advantage by the construction in the near future of mills of substantial capacity for the manufacture of lumber?" Now you answered that, "Yes; when built to safeguard owners' timber investments or to salvage timber in jeopardy from a variety of causes." But otherwise what would be the fact?

A. Under present conditions there is ample sawmill capacity in the United States to take care of the demand, I would say. But new mills may be built where present plants are obsolete, or where timber is in jeopardy from beetle, such as it is in the Klamath section

and in certain districts, or where the increasing tax burden in the county has become unbearable to the owners." (Tr., p. 2795.)

But Colonel Greeley does not even suggest that lumber products of the northwest will not soon shift from Washington to Oregon, nor does he suggest that additional railroad facilities will not be required to market this lumber. In fact he reiterates what he has said more forcefully in his previous statement on behalf of the United States forestry department when he says:

"Furthermore, in the course of time, as lumber production shifts from Washington into Oregon additional railroad facilities may be required to market efficiently the product of the new regions of heavy production."

2893 In his answers to questions submitted by carriers Colonel Greeley clearly indicates that while there may be a sufficient production of lumber at the present time to meet all demands, financial interests of individuals may require new mill construction to liquidate timber investments and that additional facilities may be required to keep pace with the shifting location of lumber production. (Tr., p. 3368.) This evidence is entirely in accord with the present views of complainants and entirely in harmony with the showing we have made in this record. Our claims herein do not rest upon an assumption that there is to be an immediate need for additional lumber in the markets of the United States but that there is an immediate demand and necessity on the part of many companies and individuals owning timber in the State of Oregon, as well as the United States Government, to market over-ripe timber, and that within the near future the shifting of lumber production from other States to Oregon will place upon this State a demand which existing transportation facilities cannot possibly meet.

Bend lumber traffic

Counsel for Southern Pacific lines object to the inclusion in the estimates of tonnage of an item of 3,410 cars of lumber from Bend for the first year and 5,115 cars in the fifth year, suggesting the Union Pacific lines would have no means of reaching the cross-

2894 State line from Bend, and if they did use the cross-State line in preference to the Des Chutes line the use of the latter would be practically abandoned.

We cannot agree that the use of the cross-State line for eastbound lumber shipments would result in the total abandonment of the Des Chutes line. It will always be necessary for the transportation of north and south traffic. As to a means of gaining access to the cross-State line we need only point out that President Budd of the Great Northern has repeatedly asserted the willingness of his company to grant joint use over any of its lines in central Oregon. This joint use already exists north of Bend; certainly there is no reason to expect any difficulty whatever in securing it south of Bend likewise. Having, then, two alternative routes for the transportation

of lumber, it is inconceivable that the Union Pacific would not select the most economical. Neither gross revenue nor fixed charges would be affected in any degree by such a choice.

Mr. Newell's study and the empty-car movement

Much is said from pages 91 to 120, inclusive, of Southern Pacific line's brief, concerning the study made by Mr. Newell with reference to savings which might be expected to result through routing of western Oregon traffic via the cross-State line. The criticism offered in connection with the Newell study deals principally with the
2895 method followed in determining the cost of empty car haul.

The comments made with reference to this matter, particularly the discussion on page 93, concerning present and expected car movements westward, is extremely unfair and misleading. In presenting his study Mr. Newell pointed out that the actual ratio of empty car movement was 95 per cent, but that such a ratio was abnormal, for which reason he adopted and used the normal rate of 60 per cent. If he had used 95 per cent, he must, to be consistent, have used it for the present Southern Pacific movement, thereby greatly increasing the cost, and for the Union Pacific portion of the movement, thus increasing its share of the cost.

It is true that the cost of movement by the cross-State line would also be increased in similar proportion, but is a mere matter of arithmetic to show that the increase by the same proportion in costs over alternative routes must in similar proportion increase the saving by the more economical route. To express the same thought in a different way, the more empty cars to be hauled westward, the more money to be saved by taking the shortest route. Thus the substitution of 95 per cent in place of 60 per cent in calculating empty car movement, instead of wiping out the entire net earnings, as claimed by carriers, would actually make a substantial increase in such net earnings.

The brief continues making the same assertion of error as between 95 per cent and 60 per cent for subsequent years, and then
2896 assumes the full supply of empty cars to come from California.

Having first asserted that an increase of 35 per cent in empty cars would reduce net earnings of the cross-State line, they next declare that reducing empty cars 60 per cent would also reduced net earnings.

We desire to most strongly emphasize the fact that the use of the actual ratio existing during the period for which the study was made, namely 95 per cent, would greatly increase the net earnings of the cross-State line, and that the 60 per cent ratio was used only in a spirit of fairness because of the belief that a 95 per cent ratio would not continue to exist if the movement of lumber from western Oregon was permitted to flow over the shorter route.

Exhibit 129 gave full credit to the Southern Pacific claim that all empty cars for lumber eastward could and would be supplied from California, although it was pointed out that Mr. Burckhalter's state-

ments, in his exhibit, did not support his contention, that California could supply all empties needed, since they showed large empty-car movements into California, through Ogden and Tucumcari.

The Southern Pacific brief, page 97, says "the general and accepted practice being to balance car interchange at all gateways." This requirement is undoubtedly enforced on the Union Pacific at Ogden.

It would be equally easy to enforce and to meet on interchange
2897 at Crescent Lake. Any possible reduction in the economies of the use of the cross-State line and of its net earnings by bringing empty cars from California was more than fully allowed for in Exhibit 129.

Furthermore, the contention now set up by the Southern Pacific as to empty-car movement is in direct contradiction to its statements repeatedly made in former cases as to the cost of empty-car supply for western Oregon.

Mr. Dey, on the basis of admittedly incomplete analysis, attacked Mr. Newell's estimates of direct cost. He bases his objections on two grounds: First, variations from the results of his own studies of operating cost on the Southern Pacific. Second, inconsistencies with the rules adopted by the United States Railroad Administration in settlement with the owners of railroads after the war.

As regards the first, Mr. Dey's observations and testimony were confined to immediate effects upon operating expenses and variations in traffic. Mr. Newell has repeatedly stated (page 9, Exhibit 16) that he has ignored such seasonal changes as Mr. Dey dealt with, and has considered the effects in changes of traffic only in considerable volume, and over such periods of time as would be necessary to separate permanent and fundamental causes from those which are temporary in their effects.

As to the second, Mr. Dey makes comparisons with the railway
2898 administration rules, which were necessarily made to cover railroads having all extremes of traffic conditions. Now, it is perfectly obvious that the percentage of any given carrier's expenses, which is direct or variable with the traffic, is dependent, not only on the nature of the expense, but upon the volume of traffic itself. For example, let it be supposed that there are two carriers whose conditions are in all respects the same, except as to volume of traffic. Now suppose that one carrier has a certain kind of expense amounting to $500 per mile, of which it has been determined that $300, or 60 per cent, is variable with the traffic, and $200 is indirect, or independent of the traffic. The other carrier's indirect expense must also be $200, but if the volume of traffic be twice as great, its direct expense will be twice $300, or $600 per mile, which is 75 per cent of its total expense on the given account. Therefore, we may have, with entire consistency, one carrier whose direct percentage is 60, and another similarly situated, whose direct percentage is 75.

It was necessary for the railroad administration, under the necessity of prompt settlement of a multitude of claims, to adopt percentages which might be applied to all cases alike, regardless of varying

conditions, and no criticism attaches to its work under those conditions; but it is obvious that the same percentage cannot possibly be accurate for all carriers.

2899 Mr. Dey concludes (page 111 of brief) that Mr. Newell's direct costs must be reduced at least one-third. On page 28, exhibit 16, Mr. Newell shows that the total operating expenses of the O.-W. R. & N. line in 1925, are 84 per cent direct, and 16 per cent indirect. Mr. Dey would change this to 56 per cent direct and 44 per cent indirect. On page 54, Mr. Newell has Oregon Short Line expenses 81 per cent direct, and 19 per cent indirect. Mr. Dey would change this to 54 per cent direct and 46 per cent indirect. That is, he would have us believe that if these carriers, each of whom has a very moderate density of traffic, could double their traffic, they would increase their operating expenses only a little over one-half. If such a relationship between operating expenses and revenues is possible, then we should expect to find all the railroads of high traffic density having extremely low operation ratios, while all those whose density was much less, should have much higher ratios. As a matter of fact, no such difference exists. Mr. Newell presented an exhibit made up from inter-State commerce commission statistics, which shows that operating ratios decrease very slowly with an increase of traffic.

For a specific illustration, the Oregon Short Line and the Union Pacific are more nearly comparable than any other roads which we can find. They are constructed through very similar territory

2900 and handle traffic of the same nature. They handle very nearly the same number of ton-miles and passenger-miles per train-mile. The Oregon Short Line had, in 1925, a traffic density of 1,120,000 ton-miles per mile road. The Union Pacific had 2,417,000, or 2.16 times as great a density. The ratio of passenger traffic is very nearly the same. The Oregon Short Line's operating expenses were $25,200,000. According to Mr. Dey only 54 per cent were direct, so the amount of direct expenses was $13,600,000 and the indirect $11,600,000. If the traffic has been 2.16 times as dense, the direct expense should have been 2.16 times as much, or $29,400,000, and indirect $11,600,000, a total of $41,000,000.

The operating revenues for 1925 were $35,500,000, with an operating ratio of 71 per cent. If these were multiplied by 2.16, the revenues would be $76,600,000, which, with operating expenses of $41,000,000 would give an operating ratio of only 53½ per cent. The operating ratio of the Union Pacific, which actually had this density, was 65 per cent.

Repeating these calculations with Mr. Newell's ratios we have, of the total operating expenses, 81 per cent direct, which equals $20,400,000, and indirect 19 per cent, or $4,800,000. For the supposed increased density, the direct would be $20,400,000 times 2.16 equals $44,000,000, and the indirect as before $4,800,000, a total

2901 of $48,800,000. Comparing this with the increased revenue of $76,600,000 gives an operating ratio of 63.8, very nearly what the Union Pacific actually had.

This comparison may be more readily understood if the revenues are left out of consideration. The operating expenses of the Oregon Short Line were $10,350 per mile of road. 54 per cent of this would give $5,590 direct, and the remainder, $4,760, indirect. For traffic 2.16 times as great, the direct would be $12,100, and indirect $4,760, making a total of $16,860 per mile for the greater volume of traffic. The expenses of the Union Pacific, which actually had the greater volume, were $19,420 per mile. If we apply Mr. Newell's ratio of 81 per cent direct, we have $8,380 direct and $1,960 indirect for the actual performance of 1925. Multiplying the former by 2.16 gives $18,100, and adding the $1,960 indirect gives a total of $20,060. Mr. Newell's figure is 3.3 per cent over the actual, while Mr. Dey's is 14.4 per cent under. These comparisons show Mr. Dey's confusion of thought as between the effects of the minor and temporary variations on which his criticisms were based, and the broader and more permanent effects which Mr. Newell considered. This destroys all value in Mr. Dey's exhibit 108, except that it is worth noting that even after his erroneous corrections of Mr. Newell's alleged errors, he still shows a rate of return greater than is ordinarily expected from a new road in its first years.

2902 In concluding the discussion concerning the Newell estimates it is stated by carrier counsel on page 115 of Southern Pacific brief that Mr. Newell conceded that his estimates of the division of rates should be substantially increased. Such is most certainly not the fact. No such admission was made. The statement attributed to Mr. Newell at page 4099 of the record is in no respect an admission of the carrier contentions in this respect. It is merely a calculation based on a hypothetical state of facts; a study which assumed, for purposes of illustration only the correctness of certain Southern Pacific claims which the witness had already shown to be incorrect, or at least doubtful. In introducing this study Mr. Newell (p. 4097) specifically stated his purpose. He said:

"So I want first to show what the effect on my figures would be if we assume the condition described by Mr. Burckhalter as completely covering the situation; that is, that all empties would come from California, no empty burden whatever on the Union Pacific."

And again at page 4099, before presenting his results, he specifically stated that the study was made "under the supposed conditions."

Whatever merit there may be to the Southern Pacific claims as to empty car movement from California, it is certain their contentions are substantially at variance with the actual conditions that

2903 have existed in the northwest over a long period of years. It is common knowledge and an undisputed fact that car shortages in the northwest have always been most severe on the lines of Southern Pacific company in Oregon, rather than on the lines of the Oregon-Washington Railroad & Navigation company or Oregon Short Line. In fact Southern Pacific company has often experienced car shortages when no shortage existed on other lines of the northwest. In the earlier hearings in this proceeding officials of that company have

asserted that western Oregon is the hardest section of the country to get empty cars into. We are unable to accept or understand their changed contention that it is an easy place for them to deliver cars.

In conclusion, we wish to remark that it is significant that the same carriers that in this case claim Mr. Newell's figures of cost are entirely too high have in the recent grain rate case attacked the same basic figures as being too low; in still another case they accepted them and introduced them in evidence. In view of their divergent views, seemingly depending upon the necessities of the case, it would seem that there can be no serious error in the figures presented by Mr. Newell.

2904 Complainant's witnesses were representative of the interests of the State and its several communities and industries

At page 133 of Southern Pacific brief it is stated that several chambers of commerce of western Oregon cities intervened in this case and offered testimony largely through their respective paid secretaries, it being inferred that such testimony is entirely irrelevant and worthy of no consideration. We fail to see the significance of such a suggestion. It is true that several witnesses on behalf of plaintiff and interveners in its behalf were chamber of commerce secretaries who are paid to represent their respective communities and to foster their development. These secretaries are, without exception, well trained and well informed individuals who have no interests save the public interest, and they have contributed much valuable evidence to this record. But to suggest that this constitutes the scope of the testimony on behalf of interveners is absurd.

Out of a total of more than 50 witnesses called on behalf of complainant and interveners in its behalf, only five were chamber of commerce secretaries. The witnesses called were most truly representative of the State of Oregon and its various interests. We do not know how we could have selected a more truly representative group of witnesses. Included in the list were the governor of

2905 Oregon, members and employees of the public Service Commission of Oregon and of the Public Utility Commission of Idaho, county agricultural agents, representatives of the State agricultural college, representatives of the University of Oregon, the United States Department of Agriculture, the United States Forestry Department, port officials, bankers, chemists, lumbermen, stockmen, and farmers. We believe the picture presented through their testimony is truly representative not only of public sentiment throughout the State of Oregon but of the great public need for the railroad construction urged in our complaint and in the many petitions of intervention.

Counsel for Southern Pacific Company refer to the testimony of witness Gilkey, secretary of the Albany Chamber of Commerce, and certain other witnesses representing the northern part of the Willamette Valley and suggest that this testimony, more or less general in nature, is truly representative of the public interest shown in this

proceeding. We challenge such a statement as being entirely at variance with the facts. It is to be admitted that the interest of the northern section of the Willamette Valley is of a more general nature, in the interest of statewide development. But this is not the interest of western Oregon as a whole nor is it the interest of the many other sections of the state, the future development of which depends almost entirely upon the construction of the line proposed.

2906 The following excerpt from the testimony of Dr. J. F. Reddy, former mayor of Medford, may be said to be far more representative of the public interest which this record discloses.

"Q. Well, what, in your opinion, would be the effect upon the State of Oregon as a whole of the construction of the cross-State line?

"A. Well, I don't know of anything that would help the State so much as the building of a cross-country line from—I don't know any one thing that the people of this State could create so much commerce, business industry, and change the complexion of the State. The State is very backward. The other States south and north and east are growing, but Oregon doesn't seem to. It has got an awful black eye. Take the mining people, the copper mining people, while they have spent ten million dollars in southern Oregon, you can't induce any of them to come in. There's lots of the biggest copper men in America have their money invested in southern Oregon, have had it for ten, fifteen, twenty years, but it is locked up there due to lack of transportation. They assumed when they went into these various projects there that if they developed them to a certain point the Southern Pacific would furnish them transportation. Now, the Southern Pacific don't furnish anybody any transportation—never has. The history of the line will show that. If you will take and analyze what they have done since the road has been completed you will find that they never have built any feeders for anybody. They have only initiated one or two lines, and they were issued from an economic standpoint, not from a public demand, and all the present feeders, while they own some of them they didn't build them,

2907 they were built by other people, and after they were proven and shown to be good things, why, then the Southern Pacific took them over—some eight of ten railroads.

"Q. You are referring now principally to the branch lines in western Oregon?

"A. Branch lines in southern Oregon and northern California.

"Q. Well, does the Southern Pacific Company own any branch lines in southern Oregon?

"A. I didn't get that question.

"Q. Does the Southern Pacific Company own any branch lines in southern Oregon?

"A. Yes.

"Q. What line do you have in mind?

"A. In southern Oregon?

"Q. Yes.

"A. No; they don't. That is, I call everywhere south of Eugene southern Oregon. They don't own any branch lines south of Eugene.

"Q. Then there are no Southern Pacific branch lines at any point south of Eugene in western Oregon, is that your testimony?

"A. Not owned by the Southern Pacific. There's two or three feeders there, like the Pacific & Eastern and the Grants Pass, but they have nothing to do with the building of those roads; they were built in spite of them. They have been proven to be good things for the community and for the Southern Pacific Railroad.

"Q. You have stated that your community is badly bottled-up, or something to that effect.

"A. Yes.

"Q. Would you restrict your testimony in that respect to your county, or does that apply to any extent in other sections of the State of Oregon?

"A. Well, the country between Eugene and Chico, California, is a zone that has but one railroad. Now, between Eugenie and Portland they have got, I think, three railroads and a river. The country
2908 between San Francisco and Chico, California, has three railroads, competing lines, and the Sacramento River. The competition stops at Eugene on the north and stops at Chico on the south—in the south. Now, then, that country, that strip of country, I think it is about three hundred, or more than three hundred miles long, it only has one railroad, and the people who live in that particular zone pay a higher freight rate than is paid in any other part of America, if you will analyze the freight rates, and, in addition to that, that country is—the freight rates retard the development of it; it keeps people out of the country. It is practically impossible for anybody to engage in any business, any line of business, to compete with people who are engaged outside of that zone, or in other words, if you engage in anything there, farming, fruit raising, mining, almost any line of human endeavor, you have got to have a superior article, you have to produce a high grade and stand the high freight rate; and a man has got to be very selective, he has got to know his business to go into that zone and compete with the fellow who lives out of the zone." (Tr., pp. 2108–2111.)

The exceptions of the Great Northern Railway Company and other so-called northern lines are taken by certain defendants upon whom it is not proposed by the commissioner to lay any duty, burden, obligation, or liability, financial or otherwise, in connection with the recommended extension. As these exceptions deal wholly with questions of constitutional law, it is assumed that the commission will not undertake to decide the merits of such contentions but will leave them to the courts.

2909 Exceptions of Union Pacific system lines

Many of the arguments advanced by counsel for Union Pacific system lines are identical with the contentions of counsel for Southern Pacific interests. Our reply to these arguments need not be repeated.

Apparently the defendants to support the first exception (page 2) go outside of the record, citing Oregon Laws of 1909 and Carey's

History of Oregon. This is not permissible as these authorities are not in evidence.

The second exception (page 3) advances a novel proposition of law, namely, that one or two carriers by building certain lines by permission of the commission appropriate and occupy "all of the traffic producing territory" in a contiguous area of many thousands of square miles, so that the commission is debarred from permitting or requiring another line to build into that area or across it. No such vested rights attach to the certificates of convenience and necessity issued by the commission. A mere statement of the contention defeats it. But the Union Pacific system is in a peculiarly unfortunate position to argue this point, having spent many millions to build to Puget Sound and to Yakima (both already well served by other railroads) and to try to get a line into Bend from the Columbia River ahead of the Oregon Trunk Railway.

2910 The third exception (page 4) is without merit. Defendants argue that "the commission in ordering the extension of a line" into territory not already served by the carrier involved in effect "would undertake to require a carrier to extend its charter rights." Does this mean a contention that, if the commission ordered this extension built and the Union Pacific system lines obeyed the order under protest, their acts in so doing would be ultra vires? If so, is it to be understood that the Oregon-Washington Railroad & Navigation company before building the Burns branch procured its charter to be amended or extended for that purpose?

The fourth exception should be over-ruled: First, because it raises questions of constitutional law, which it is seemly for commission to leave to the courts; second, because the proposed line unquestionably is an extension within the meaning of the statute, which has supplemented the charter duties of the defendants in this respect just as it has done with respect to the duty of the defendants to abstain from charging unreasonable, unjustly discriminatory or unduly prejudicial rates, which duty defendants would owe whether their charters imposed it or not; and third, because the statute does not require as a condition precedent to a valid order for an extension like the proposed line a showing that the new line, when built, will be self-sustaining.

2911 The fifth exception (page 6) is to the proposed finding of "longer haul and greater time consumed" via existing routes and the Alturas route (not yet in use) than would be necessary via the proposed extension. That the building of the proposed extension would provide much shorter routes for a great deal of traffic both perishable and nonperishable is not denied. This exception is sought to be supported by argument based on the differences between the estimates by witnesses for complainant and defendants of the traffic that in reason might be expected to move over the proposed extension. The proposed finding has ample support in the evidence, although the evidence is conflicting upon the subject of the amount of traffic that will be available to the proposed extension, when built.

These defendants seem to assume (page 9) that the proposed extension would be "maintained" at a lower "standard of efficiency" than the routes via Alturas and Portland. Why should the Union Pacific system maintain its line from Ontario to Crescent Lake (assuming the proposed extension is built) less efficiently than its line from Ontario to Portland? The "standard of efficiency" of the Alturas route has not been demonstrated. Only the future will disclose it. In discussing this exception the defendants have avoided mentioning the Roseville route, over which most of the traffic to and from western Oregon has moved in the past and now moves. The route
2912 via the proposed line is much shorter for a great deal of the traffic now moving than the Roseville route. Whether the Alturas route will drain away most of the traffic that now goes by Roseville simply because it is somewhat shorter remains to be seen. After the Rogerson-Wells line was put into operation, much traffic continued to move between southern Idaho and California via the longer route through Ogden. But in this proceeding the commission can and doubtless will insure the movement over the proposed line of so much traffic as in its judgment the public convenience and necessity may require by attaching to its order for the extension appropriate terms and conditions. In this respect an order for extension, complainant believes, is not different from a certificate issued under paragraph (20) of section 1 of the interstate commerce act.

These defendants argue (page 12) that the construction of the proposed extension would cause "the huge investments made by the Southern Pacific to handle this same traffic" to become "wasteful and improvident capital expenditure." This argument is based on the false assumption that the proposed line, when built, will handle only traffic that now moves via Roseville and that will move via Alturas when that line will have been completed and put into operation. Furthermore, with the completion of the Alturas line and of the
2913 proposed line there will be four routes between western Oregon and eastern territories, one via Roseville, another via Alturas, another via Crescent Lake, and another via Portland. All the traffic by the first three of these routes will be handled by the Union Pacific and Southern Pacific systems. This is also true of practically all of the traffic through the Portland gateway.

Compare this situation with that in California. Between western California and eastern points the Southern Pacific has two routes (one via Ogden and the other via El Paso). The Union Pacific, the Western Pacific and the Santa Fe also form additional routes.

Between western Washington and eastern territories there are routes by the Great Northern, the Northern Pacific, the Chicago, Milwaukee, St. Paul & Pacific, and the Union Pacific system.

It does not appear that in comparison with California and Washington the construction of the proposed line will provide Oregon with more rail routes than are reasonably necessary for transcontinental traffic alone—not to mention the local development that the proposed line will foster and promote.

The sixth exception (page 59) is sought to be supported by the argument in effect that central and eastern Oregon have no productive areas "tributary to the proposed line to be served by it."
2914 But that argument begs the whole question. A railroad and an opportunity to get to markets over it from many thousands of square miles in Oregon must be provided before there can be the production in that area that would go far toward making the proposed line self-sustaining. Full-fledged production in an area to be served by a railroad to be built is not a condition precedent to the issuance of a certificate authorizing or of an order requiring its construction. Much that is urged in support of this exception could be said with equal force of the Rogerson-Wells line—a Union Pacific system project.

Furthermore, the evidence, though conflicting, does establish that a very substantial volume of traffic from the country tributary to the proposed line will be available as soon as it is open for operation. The traffic estimates of witness Teutsch are not the unsubstantial rosy visions that the defendants would make them out to be. On the contrary they are based on intimate knowledge, are conservative, and, if anything, are understated. Indeed, witness Teutsch's estimates were confirmed and corroborated by other well informed witnesses with respect to practically every item of traffic he included in his exhibit and explained in his testimony. This exception should be overruled.

The seventh exception (page 60) is utterly groundless, as it states the facts exactly. It is argued that the proposed line is "a disconnected fragment of lines originally planned" and that the
2915 dissolution of the Union Pacific-Southern Pacific merger interferred with the consummation of the construction planned. A considerable part of the construction planned originally was completed. Moreover, notwithstanding the dissolution of the merger the Southern Pacific without compulsion later closed one of the two gaps left by building the so-called Natron cut-off, but the Union Pacific has refused to close the other by building the proposed line and so virtually to complete the construction originally planned about 1906. The cross-State line was a decidedly meritorious project when it was planned for the first time and its merit has not been lost through the dissolution of the merger or other subsequent events. Its purpose was to save distance, time, and money in the transportation of traffic between western Oregon and the east and to develop the country tributary to it. Those same factors now justify its construction as they did then.

The Union Pacific system can not maintain successfully that it would have no substantial volume of traffic between western Oregon and the east for movement over the proposed line. Westbound tonnage that it handles now to Portland and there turns over to the Southern Pacific it could handle over the proposed line to Crescent

Lake and there turn it over to the Southern Pacific. The Union Pacific system's division of the joint rate certainly would not
2916 be less via Crescent Lake than via Portland and the cost of the service from Ontario to Crescent Lake would be less than from Ontario to Portland. On eastbound traffic the Union Pacific system has joint rates with the Southern Pacific via Portland. There could be no reason why joint rates on the same basis should not be made between the two systems via Crescent Lake. The Southern Pacific has joint rates on lumber via Portland to eastern points on the Great Northern and Northern Pacific. Much traffic for movement east from western Oregon through both the Portland and Crescent Lake gateways doubtless could be obtained by an intense, diligent, and persistent solicitation on the part of the Union Pacific's system. And unquestionably a very considerable volume of tonnage can be expected to be routed by Crescent Lake and Ontario by the shippers. The Union Pacific system has not yet seen fit to attempt the invasion of western Oregon, although it has invaded almost every other competitive railroad field in the Pacific northwest. When the Union Pacific system has made a convincing case, doubtless the commission will permit it to build lines into the Willamette Valley, if it asks for a certificate.

The eighth exception (page 68) is technical in the highest degree. It is a perfect example of the shadow given more importance than the substance. The Oregon-Washington Railroad & Navigation Company would have no difficulty in obtaining through negotia-
2917 tion with the Great Northern trackage rights from Bend south to the junction with the cross-State line. And the only difficulty the Oregon-Washington Railroad & Navigation Company could have in getting "access" to the eastern end of the proposed line would have to be interposed by the Oregon Short Line, which owns the Union Pacific system's rails from Ontario to Huntington. Such a difficulty is hardly to be anticipated. In this respect the Burns branch of the Oregon-Washington Railroad & Navigation Company is in exactly the same situation as the proposed line.

The ninth exception (page 69) the fortieth (page 189) may be discussed together. Both are bad. The supreme court of the United States has said (Interstate Commerce Commission v. Union Pacific Railroad Co., 222 U. S. 541, 547) that it is an "elementary rule that the substance and not the shadow, determines the validity of the exercise of the power." The facts found in the proposed report respecting the intercorporate relationships of the Union Pacific Railroad Company, the Oregon Short Line Railroad Company, and the Oregon-Washington Railroad & Navigation Company and their operation as one system under common management and control are not denied and could not be.

In Chicago, Milwaukee & St. Paul Railway Company v. Minneapolis Civic & Commerce Association, 247 U. S. 490, a judgment was affirmed of the Supreme Court of Minnesota, which
2918 affirmed an order of the Minnesota commission, by which two carriers were required to treat the tracks of a subsidiary company as if a part of their terminal system. At pages 493 and 494 of the decision it is said:

"Thus, the question presented for our decision is whether the Eastern Company, in form a corporate entity, separate and distinct from the Milwaukee and Omaha Companies, is in reality an independent carrier, exercising an independent control over the railroad to which it holds the legal title and over the conduct of its business affairs, or whether it is a mere agency or instrumentality of the two corporations, which own all of its capital stock, through which they collect an extra charge from the public for rendering by indirection a service which, as common carriers, they are legally required to render without such charge, under the conditions of operation which prevail at Minneapolis.

"With the facts thus summarized, it is difficult to conceive of a plan for the control of a jointly owned company and for the operation of a jointly owned track more complete than this one is, and it is sheer sophistry to argue that, because it is technically a separate legal entity, the Eastern Company is an independent public carrier, free in the conduct of its business from the control of the two companies which own it, and therefore free to impose separate carrying charges upon the public."

And at page 501:

"In such a case the courts will not permit themselves to be blinded or deceived by mere forms of law, but, regardless of fictions, will deal with the substance of the transaction involved as if the corporate agency did not exist and as the justice of the case may require.
2919 "Satisfied as we are by the evidence that the Eastern Company is a completely controlled agency of the two companies which own its capital stock, we agree with the Supreme Court of Minnesota that the fact that the legal title to what are obviously terminal or spur delivery tracks is in the Eastern Company should not be permitted to become the warrant for permitting a charge upon shippers greater than they would be required to pay if that title were in the owning companies. The order of the commission, affirmed by the Supreme Court of Minnesota, so far from being arbitrary, is plainly just; and clearly it does not deprive the plaintiffs in error of their property without compensation or without due process of law, by requiring, as it does, that for rate-making purposes the Milwaukee and Omaha Companies shall extend to shippers over their tracks, the legal title to which is in the Eastern Company, equality of treatment with that which they give to shippers over their separately owned tracks, where similiar service is rendered."

Now for rate-making purposes the Union Pacific Railroad Company, the Oregon Short Line Railroad Company, and the Oregon-

Washington Railroad & Navigation Company are a single line by their own voluntary action. The Union Pacific Railroad Company has it in its power to absorb the other two lines and to cause them as corporate entities to be dissolved and to operate the existing lines from Council Bluffs to Portland. For all practical purposes the Union Pacific Railroad Company does own and operate a line
2920 from Council Bluffs to Portland. Should these three carriers be considered a single line for as important a purpose as rate-making and not for the purposes expressed in sub-paragraph (21) of section 1 of the interstate commerce act? These two exceptions are a sort of razzle dazzle that finds on support in the law.

In Southern Pacific Terminal Co. v. Interstate Commerce Commission, 219 U. S. 498, it was held that a corporation created to carry on, conformably to a municipal ordinance and a confirmatory statute intended to secure public shipping facilities, a wharfage business at a seaport, and to furnish terminal facilities for a railway and steamship system of which it formed a part and by which it was controlled through a holding company, was a common carrier, and as such was subject to the jurisdiction of the Interstate Commerce Commission acting in the exercise of its authority, under the act to regulate commerce, to prohibit undue preferences. At page 521 of the decision it was said:

"Another and important fact is the control of the properties by the Southern Pacific Company through stock ownership. There is a separation of the companies if we regard only their charters; there is a union of them if we regard their control and operation through the Southern Pacific Company. This control and operation are the important facts to shippers. It is of no consequence that by
2921 mere charter declaration the terminal company is a wharfage company, or the Southern Pacific a holding company. Verbal declarations can not alter the facts. The control and operation of the Southern Pacific Company of the railroads and the terminal company have united them into a system of which all are necessary parts, the terminal company as well as the railroad companies."

At Page 523:

"In opposition to these views appellants urge the legal individuality of the different railroads and the terminal company, and cite cases which establish, it is contended, that stock ownership simply or through a holding company does not identify them. We are not concerned to combat the proposition. The record does not present a case of stock ownership merely, or of a holding company which was content to hold. It presents a case, as we have already said, of one actively managing and uniting the railroads and the terminal company into an organized system. And it is with the system that the law must deal, not with its elements. Such elements may, indeed, be regarded from some standpoints as legal entities; may have, in a sense, separate corporate operation; but they are directed by the same paramount and combining power and made single by it. In all transactions it is treated as single."

Where the corporate form of organization is adopted in an endeavor to evade a statute or to modify its intent, courts will disregard
2922 the corporate concept and look at the substance and reality of the matter. United States v. Lehigh Valley Railroad Co., 220 U. S. 257; Northern Securities Co. v. United States, 193 U. S. 197.

In Stockton v. Central Railroad Co., 50 N. J. Eq. 52, 24 Atl. 964, it was said (pages 972 and 973):

"In the face of such a situation it is idle to say that the Port Reading Railroad Company is not in all things, save in its intangible and unsubstantial corporate entity, the Philadelphia & Reading Railroad Company. It is only necessary to state these particulars to satisfy the mind of the justice of this conclusion. 'The statement,' says Mr. Morawetz in his work on corporations (section 227), 'that a corporation is an artificial entity, apart from its members, is merely a description, in figurative language, of a corporation viewed as a collective body. A corporation is really an association of persons, and no judicial dictum or legislative enactment can alter this fact.' 'It is a certain rule,' said Lord Mansfield in Johnson v. Smith, 2 Burrows, 962, 'that a fiction of law shall never be contradicted so as to defeat the end for which it was invented, but for every other purpose it may be contradicted.' It follows from the conclusion reached that the intervention of the Port Reading Company as nominal lessee is but a device to disguise the real nature of the transaction. It is demonstrated as clearly as words could state it that the object of the transaction was to place the Central Railroad within the Philadelphia & Reading Railroad system. The Central's reliance was not
2923 upon the small, unfinished road, with a comparatively petty capital, and little or no valuable assets, but upon the Philadelphia & Reading Railroad Company, that estimated its assests at $200,000,000. It is sticking in the bark to say that in this transaction the Philadelphia & Reading Railroad Company is not the real lessee, and that the guaranty executed by it is not the real lease. The misnomer of papers, and the use of a nominal lessee, does not change the substance of the transaction with which this court deals. The situation here may be summed up in the words of Vice Chancellor Kindersley in Attorney General v. Great Northern Ry. Co., 1 Drew. & S. 157 (6 Jur., N. S., 1006, 29 Law J. ch. 794): 'A more flimsy device, when the particulars are once known, it is impossible to imagine. It may succeed for a time in baffling persons who may have an interest in preventing its being done, and has succeeded; but it was a mere crafty contrivance to evade the requisition of the law on the subject of joint-stock companies.' It must not be thought that courts are powerless to strip off disguises to thwart the purposes of the law. Whenever such disguises in fact appear, they can readily be disrobed. The difficulty is in showing the disguises, not in penetrating them when they appear. Attorney General v. Great Northern Ry Co., supra; Pennsylvania R. Co. v. Com. (Pa. Sup.), 7 Atl. Rep. 368; People v. Chicago Gas Trust Co., 130 Ill. 268, 22 N. E. Rep. 798; People v.

North River Sugar Refining Co., 121 N. Y. 582, 24 N. E. Rep. 834; State v. Standard Oil Co. (Ohio), 30 N. E. Rep. 279."

2924 In State v. Chicago & Northwestern Railway Co., 158 N. W. (Minn.) 627, the Supreme Court of Minnesota affirmed a judgment setting aside an order of the railroad and warehouse commission, in so far as it fixed a joint rate between the Chicago & North Western Railway Company and the Chicago, St. Paul, Minneapolis & Omaha Railway Company. Many decisions of Federal and State courts were cited in the opinion, which concludes (pages 629 and 630):

"It was the fixed purpose of the Northwestern when Vanderbilt with the concurrence of its president arranged for the acquisition of a majority of the Omaha stock to bring the two roads under one control and operation. It meditated no wrong and did none. Business sagacity prompted the purchase and no public policy was offended. It was beneficial to the companies and to the public. The present operation is not the result of a cooperation of two distinct companies having separate interests. The directing control of the two roads is one and single. There is a single and paramount control and domination of both properties and a unity of operation as a continuous line. Whatever the form this is the reality."

2925 In Buie v. Chicago, Rock Island & Pacific Railway Co., 65 S. W. (Tex.) 27, the supreme court of that state said (page 31):

"By organizing the Chicago, Rock Island & Texas Railway Company, and through it operating the railroad in Texas, the Chicago, Rock Island & Pacific Railway Company was doing its business in Texas by and through those persons who purported to represent the subcorporation, and the principal corporation was legally in Texas through its said agents, and was liable to suits in the courts of this state by service of process upon the agents which represented it in that business. * * * The authorities cited fully sustain the proposition that, when one corporation makes use of another as its instrument through which to perform its business, the principal corporation is really represented by the agents of the subcorporation, and its liability is just the same as if the principal corporation had done the business in its own name."

The foregoing cases are sufficient to show that these two exceptions are wholly lacking in merit.

The remaining exceptions of the Union Pacific system lines cover topics that have been discussed at length elsewhere herein in reply to the exceptions of the Southern Pacific Company.

2926 In conclusion, we submit that the carrier exceptions to the report of Commissioner McManamy are without merit, and the report should be adopted.

Respectfully submitted.

2927 *Defendant's Exhibit E*

Interstate Commerce Commission, Washington

I, George B. McGinty, secretary of the Interstate Commerce Commission, do hereby certify that the attached is true and correct extract from page 3 of the carriers' protest filed June 6, 1923, in valuation docket No. 329, tentative valuation report on the properties of Oregon-Washington Railroad & Navigation Company, Des Chutes Railroad Company, the original of which is now on file and of record in the office of this commission.

In witness whereof I have hereunto set my hand and affixed the seal of said commission this 4th day of December, A. D. 1930.

GEORGE B. MCGINTY,
[SEAL.] *Secretary of the Interstate Commerce Commission.*

U. S. district court, District of Oregon. Filed, Dec. 9, 1930, G. H. Marsh, Clerk.

2928 4. The lines of the Union Pacific Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, Los Angeles & Salt Lake Railroad Company, and The St. Joseph & Grand Island Railway Company, together with the interest of those companies in affiliated carrier properties, constitute the Union Pacific system. This system of railroad, aggregating about 9,600 miles, is in common ownership and operated as an entity, and is such a system as under section 15a of the interstate commerce act must be considered as an entity.

2929 In United States District Court for the District of Oregon

(In Equity No. E-9113)

OREGON-WASHINGTON RAILROAD & NAVIGATION COMPANY, PETITIONER

v.

UNITED STATES OF AMERICA, DEFENDANT, AND INTERSTATE COMMERCE COMMISSION, Public Utilities Commissioner of Oregon (Successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, intervening defendants

Order granting further extension of time to file record on appeal

Filed Jan. 13, 1932

Good cause shown, and upon the stipulation of counsel for all parties of record,

It is ordered, that the intervening defendants herein be, and they are hereby, allowed additional time to and including March 31, 1932, in which to file the record on appeal in this cause in the Supreme Court of the United States.

JOHN H. MCNARY,
United States District Judge.

January 8th, 1932.

Consented to:

J. STANLEY PAYNE,
Solicitor for Interstate Commerce Commission.

2930 I. H. VAN WINKLE,
Solicitor for Public Utilities Commissioner of Oregon (successor of Public Utilities Commission of Oregon).

J. M. THOMPSON,
Solicitor for Public Utilities Commission of the State of Idaho.

ARTHUR C. SPENCER,
Solicitor for Oregon-Washington Railroad & Navigation Company.

ALFRED A. HAMPSON,
Solicitor for Southern Pacific Company.

CHARLES A. HART,
Solicitor for Great Northern Railway Company.

CHARLES A. HART,
Solicitor for Oregon Trunk Railway.

CHARLES A. HART,
Solicitor for Oregon Electric Railway Company.

2931 [File endorsement omitted.]

2932 In Supreme Court of the United States

Statement of points intended to be relied upon and stipulation of parts of record to be printed

Filed Mar. 25, 1932

Come now Interstate Commerce Commission, Public Utilities Commissioner of Oregon (successor of Public Service Commission of Oregon), and Public Utilities Commission of the State of Idaho, appellants in the above-entitled case, and state that the points upon which they intend to rely in this court in this case are as follows:

1. Section 1 (21) of the interstate commerce act, in unambiguous terms, empowers the commission to authorize or require by order any carrier by railroad subject to the act to extend its line or lines, subject to the two limitations there specified.

2. The commission's order, requiring the Union Pacific system to extend its lines, upon a showing and finding, responsive to the applicable statutory provision, that the extension is reasonably required in the interest of public convenience and necessity, that the expense involved will not impair the carrier's ability to perform its duty to the public, and that the facts otherwise warrant the construction, is within the power conferred upon the commission by section 1 (21) of the act.

2933 3. The commission correctly found and held that this provision of the statute, in plain language, empowers it to authorize or require a carrier subject to the act to extend its line or lines, and that, there being no ambiguity in the language, there is no room for construction.

4. When the provision in question is read in the light of the act as a whole, and especially in connection with other provisions added by the transportation act of 1920, which have for their purpose the building up of an adequate railway system for the whole of the United States, the meaning conveyed by the words used in section 1 (21) is confirmed.

5. The legislative history of the 1920 amendments also confirm the meaning of the words used in section 1 (21).

6. The meaning of the words used in this provision is also confirmed by those used in paragraphs 18 and 22 of section 1 and in paragraph 13 (a) of section 6.

7. Paragraphs 18, 19, and 20 of section 1, prohibiting the construction, abandonment, or extension of lines, or acquisition or operation of any line or extension thereof, unless and until there shall first have been obtained from the commission a certificate that the present or future public convenience and necessity require or will require the construction or operation, or construction and operation, of such additional or extended line of railroad, or permit of such abandonment, confer a negative or restraining power upon the commission, and prevent voluntary action by carriers except where such action is found by the commission to be in the interest of public convenience and

necessity. Paragraph 21 contemplates construction of extensions of existing lines of railroad demanded by public convenience and necessity which the carriers are unwilling to construct voluntarily,
2934 and confers the affirmative authority upon the commission, when it makes the requisite findings, to require such extensions.

8. There is no foundation in the language of the statute for a limitation upon the power conferred to comparatively short extensions in territory already served by the carrier involved. If such had been the intention it is to be presumed that apt language expressive thereof would have been used. But no such limitation was enacted. The language that was used contains definite and sufficient limitations, the first being that the extension "is reasonably required in the interest of public convenience and necessity," and when the true meaning and binding force of this clause is borne in mind in conjunction with the fact that this is the criterion and only standard of action provided in many other important and remedial provisions of the interstate commerce act, the real limitation becomes apparent. The second limitation is that the expense involved will not impair the ability of the carrier to perform its duty to the public and this, too, operates as a very definite limitation. These were the only limitations Congress imposed. To read additional limitations into the act is to amend it by judicial action.

9. Section 1 (21) is not susceptible of the construction that it is "limited to such extensions as are reasonably necessary to reach communities and industries in the territory which the carrier has professed to serve or according to the undertaking which it has expressly or impliedly assumed," as held by the court below.

10. The language of the statute, as well as the commission's recommendation in pursuance of which the statute was enacted, show that the intention was to require a carrier to build into and
2935 develop undeveloped territory, as well as to build short branch or spur lines or spur tracks in developed territory, if the building is reasonably required in the interest of public convenience and necessity and the expense involved will not impair the carrier's ability to perform its duty to the public.

11. To construe the provision in question as the court below construed it, whereby it would be limited to extensions in territory which the carrier has professed to serve or according to the undertaking which it has expressly or impliedly assumed, is to emasculate the provision, for that construction would limit the provision to extensions which the carrier is willing to construct voluntarily, and if the carrier were unwilling to build an extension into a given territory it could profess not to serve that territory, whereas section 1 (21) plainly contemplates the construction of extensions which the carrier is required to build against its will. Other provisions, especially paragraphs 18, 19, and 20 of section 1, fully cover voluntary constructions, and if paragraph 21 be construed as applicable only where the carrier professes to serve the communities, industries, or territory to be reached by the extension, then paragraph 21 stands without force or application.

12. The reasoning of the court below to the effect that a carrier may not be "required to devote its property to a service which it has never professed to render and to a service entirely beyond the scope of the undertaking which it has expressly or impliedly assumed," is erroneous as a matter of law, contrary to numerous provisions of the interstate commerce act, and contrary to many decisions of the Supreme Court of the United States.

2936 13. The court below erred in holding that section 1 (21) "is susceptible to two constructions, by one of which grave and doubtful constitutional questions arise and by the other of which such questions are avoided," for the reason that inasmuch as no ambiguity exists in the language there is no room for construction.

14. The provision of the interstate commerce act for compulsory extensions of lines is a regulation of commerce within the power of Congress.

15. As applied in the case at bar, section 1 (21) contravenes no constitutional limitation upon the power of Congress to regulate interstate commerce.

16. The court below erred in holding that the construction placed by the commission on section 1 (21) is neither necessary nor permissible, for the reason that the commission properly applied the provision according to its plain terms, properly held that it is "bound by the words employed" and is "not at liberty to conjure up conditions to raise doubts in order that resort may be had to construction," and properly held that there is no room for construction of the provision because no ambiguity exists therein.

17. The evidence before the commission fully established that the construction of the ordered extension would be in the interest of public convenience and necessity.

18. The evidence before the commission fully established that the expense involved in building the extension would not impair the ability of the carrier to perform its duty to the public.

2937 19. The order in question does not exceed the commission's authority and is not based upon error of law, a full hearing was granted, the findings which support the order are fully justified by the evidence, and the order is valid in every respect.

And the appellants further state that the parts of the record, as filed in this court, which need be printed by the clerk for hearing of the case, are the parts set out in a stipulation of counsel for all parties, filed herewith.

J. STANLEY PAYNE,
Solicitor for Interstate Commerce Commission.
J. H. VAN WINKLE,
Solicitor for Public Utilities Commissioner of Oregon (successor of Public Service Commission of Oregon).
J. M. THOMPSON,
Solicitor for Public Utilities Commission of the State of Idaho.

Service of the above statement is hereby accepted January 7th, 1932.

ARTHUR C. SPENCER,
Solicitor for Oregon-Washington Railroad & Navigation Company.

ALFRED A. HAMPSON,
Solicitor for Southern Pacific Company.
CHARLES A. HART,
Solicitor for Great Northern Railway Company.
CHARLES A. HART,
Solicitor for Oregon Trunk Railway.
CHARLES A. HART,
Solicitor for Oregon Electric Railway Company.

2938 *Stipulation as to printing record and exhibits*

It is stipulated by the parties hereto that the following shall govern the printing of the record of the District Court in the appeal in the above-entitled cause.

Omit from printing the following:

Petitioner's Exhibit No. 1 before the District Court, stipulation regarding introduction in evidence before the District Court of certified copies of documents on file with Interstate Commerce Commission.

Petitioner's Exhibit No. 4 before the District Court, except that part consisting of joint answer of Des Chutes Railroad Company, Oregon Short Line Railroad Company, Oregon-Washington Railroad & Navigation Company, and Union Pacific Railroad Company to complaint in docket No. 19680 before the Interstate Commerce Commission.

Petitioner's Exhibit No. 6 before the District Court, certified copy of brief submitted to Interstate Commerce Commission by complainant in docket No. 19680, Oregon Public Service Commission *v.* Central Pacific Ry. Co. et al.

2939 Petitioner's Exhibit No. 7 before the district court, certified copy of report and order of Interstate Commerce Commission entered December 3, 1930, in docket No. 19680 (same being Exhibit B to the petition).

Petitioner's Exhibit No. 9 before the district court, certified copy of brief submitted to Interstate Commerce Commission by complainant in docket No. 14392, Public Service Commission of Oregon v. Central Pacific Ry. Co., et al.

The following exhibits introduced before the Interstate Commerce Commission in docket No. 19680, Oregon Public Service Commission v. Central Pacific Ry. Co., et al. (which were part of petitioner's Exhibit No. 3 before the district court):

I. C. C. Exhibits Nos.

3	29	43	74	102	116	125
4	30	44	94	103	117	126
13	31	45	95	109	118	127
15	32	46	96	110	119	128
16	37	47	97	111	120	129
16a	39	48	98	112	121	131
17	40	49	99	113	122	132
20	41	52	100	114	123	133
21	42	73	101	115	124	134

With the above exceptions the entire record now on file shall be printed in the customary manner.

Of the exhibits so omitted from printing, counsel for appellants, shall, before the cause comes up for argument in the Supreme Court, furnish to the clerk 10 copies of the following exhibits introduced before the Interstate Commerce Commission in said docket
2940 No. 19680, and constituting a part of petitioner's Exhibit No. 3 before the district court, which shall be suitably bound for submission to the justices of the court, to wit, I. C. C. Exhibits Nos.—

3	32	52	110	115	120	125
13	37	73	111	116	121	126
15	39	74	112	117	122	127
16	40	99	113	118	123	128
16a	47	109	114	119	124	129
17						

It is further stipulated and agreed that counsel for any of the parties may in his brief or argument refer to any exhibit or portion thereof introduced in evidence before the Interstate Commerce Commission in said docket No. 19680, or in the district court that is not included in the printed transcript of the record in this court and not included in the aforesaid list of exhibits of which 10 copies shall be provided for the use of the justices.

It is further agreed that this stipulation be printed by the clerk as part of the record on appeal.

J. STANLEY PAYNE,
Solicitor for Interstate Commerce Commission.
J. H. VAN WINKLE,
Solicitor for Public Utilities Commissioner of Oregon (successor of Public Service Commission).
J. M. THOMPSON,
Solicitor for Public Utilities Commission of the State of Idaho.
ARTHUR C. SPENCER,
Solicitor for Oregon-Washington Railroad & Navigation Company.
ALFRED A. HAMPSON,
Solicitor for Southern Pacific Company.
CHARLES A. HART,
Solicitor for Great Northern Ry. Co.
CHARLES A. HART,
Solicitor for Oregon Trunk Railway.
CHARLES A. HART,
Solicitor for Oregon Electric Ry. Co.
